## INTRODUCTION

Thank you for choosing the Mitsubishi MELSEC-A Series of General Purpose Programmable Controllers. Please read this manual carefully so that the equipment is used to its optimum. A copy of this manual should be forwarded to the end User.

## CONTENTS

1. INTRODUCTION ..... 1-1
2. SYSTEM COMFIGURATION ..... 2-1~2-4
2.1 Overall Configuration ..... 2-1
2.2 Applicable Systems ..... 2-3
2.3 Programming Equipment ..... 2-4
3. SPECIFICATIONS ..... 3-1~3-60
3.1 General Specifications ..... 3-1
3.2 Performance Specifications and Functions .....  $3-2$
3.2.1 Performance specifications ..... 3-2
3.2.2 Functions .....  $3-3$
3.3 General Description of Positioning System Operations .....  $3-5$
3.3.1 Positioning system using an A1SD71 .....  3-5
3.3.2 Signal communications between an A1SD71 and each unit ..... 3-7
3.3.3 A1SD71 operation description .....  $3-8$
3.4 Types and Functions of Setting Data ..... 3-10
3.4.1 Parameters .....  3 - 10
3.4.2 Zero return data .....  $3-20$
3.4.3 Positioning data .....  $3-25$
3.5 Buffer Memory ..... 3-32
3.5.1 Positioning start data .....  $3-34$
3.5.2 Error reset (Address 201) .....  3-46
3.5.3 Inching output speed area ( X axis: address 202, Y axis: address 502) ..... 3-46
3.5.4 OS data area (Addresses 512 to 767) .....  $3-47$
3.5.5 Positioning data area ( X axis :address 3872 to $5871, \mathrm{Y}$ axis :address 5872 to 7871) ..... $.3-48$
3.5.6 Parameter area ( X axis :address 7872 to 7887, Y axis :address 7892 to 7907) .....  $3-49$
3.5.7 Zero return data area ( X axis :address 7912 to 7918, Y axis :address 7922 to 7928) ..... $.3-50$
3.6 I/O Signals To and From A1S CPU .....  $3-51$
3.7 I/O Interface with External Equipment .....  $3-57$
3.7.1 A1SD71 electrical specifications .....  $3-57$
3.7.2 Pulse leading/trailing edge times of A1SD71 output signals .....  $3-58$
3.7.3 Input/output interface specifications of the A1SD71 and an external device .....  $3-59$
3.8 Battery Specifications .....  $3-60$
4. HANDLING ..... 4-1~4-3
4.1 Handling Instructions ..... 4-1
4.2 Nomenclature .....  $4-2$
4.3 Settings .....  $4-3$
4.3.1 Battery connection ..... 4-3
5. LOADING AND INSTALLATION ..... 5-1~5-4
5.1 Unit Wiring Precautions ..... 5-1
5.2 Wiring .....  5 - 1
5.2.1 Wiring precautions ..... 5-1
5.2.2 External wiring connector specifications .....  $5-3$
5.2.3 Connecting external wiring ..... 5-4
5.2.4 Connecting electric wiring .....  5-4
6. PROGRAMMING ..... 6-1~6-47
6.1 Program Creation ..... 6-1
6.1.1 Program composition .....  $6-1$
6.1.2 Precautions when creating programs .....  6 - 3
6.2 Operations Using a Peripheral Device or AD71TU .....  6 - 4
6.3 ACPU Programming .....  6 - 5
6.3.1 Data read and write precautions .....  $6-5$
6.3.2 Data communication with PC program ..... 6-6
6.3.3 Positioning start program .....  $6-14$
6.3.4 Jog operation program .....  $6-22$
6.3.5 Manual pulse generator operation program .....  $6-25$
6.3.6 Positioning address teaching program .....  6-30
6.3.7 Zero return .....  $6-38$
6.3.8 Present value change .....  $6-40$
6.3.9 Positioning stop .....  $6-42$
7. CHECK LISTS ..... 7-1~7-3

## 1. INTRODUCTION

This manual explains the specifications, handling, and programming methods of the A1SD71-S7 positioning module (hereafter called the A1SD71) used with a MELSEC-A series A1SCPU.
In this manual, the term "Positioning control" includes speed/positioning control and speed control.
The following are called peripheral devices in this manual:
The AD71TU teaching unit is referred to as the AD71TU.

- A6GPP graphic programming panel $\quad$ A6PHP plasma handy graphic programmer $\quad$ (
- AD71TU teaching unit $\longrightarrow$ AD71TU

Refer to the following manuals:

- SWOGP-AD71P Operating Manual
- A6GPP User's Manual
- AD71TU Operating Manual
- Manual Relevant drive unit instruction manuals
- A1SCPU User's Manual

The functions and specifications of A1SD71 are the same as those of the AD71(S1) except for the following:

| Modules | A1SD71-S7 | AD71(S1) |
| :--- | :--- | :--- |
| Items | 48 points (empty 16 points + 32 points) | 32 points |
| Number of I/O points | A1SCPU | All MELSEC-A series PC CPUs except the <br> A2CCPU |
| Applicable PC CPUs | Master station, local station | Master station, local station, remote I/O <br> station |
| Applicable installation <br> positions in the data link <br> system | 10 to $20000 \mathrm{PLS} / \mathrm{sec}$. | $20000 \mathrm{PLS} / \mathrm{sec}$. |
| Output speed during inching <br> operation | $5 \mathrm{VDC,0.8A}$ | $5 \mathrm{VDC}, 1.5 \mathrm{~A}$ |
| Internal current consumption | $250(\mathrm{H}) \times 37.5(\mathrm{~W}) \times 121(\mathrm{D})$ <br> $(9.84 \times 1.48 \times 4.76)$ |  |
| Sizes mm (inch) | $130(\mathrm{H}) \times 69.5(\mathrm{~W}) \times 93.6(\mathrm{D})$ <br> $(5.12 \times 2.74 \times 3.69)$ | $0.63(1.39)$ |
| Weights $\mathrm{kg}(\mathrm{lb})$ | $0.38(0.84)$ |  |

Be sure that the following items are included in the package.

| Item | Quantity |
| :--- | :---: |
| A1SD71-S7 positioning module | 1 |
| 40 - pin connector for external wiring | 1 |

## POINT

In this manual A1SD71 I/O numbers assigned from the PC CPU assume that the A1SD71 is loaded in slots 0 and 1 of the main base.

## 2. SYSTEM CONFIGURATION

### 2.1 Overall Conflauration

Fig. 2.1 Overall Configuration

### 2.2 Applicable Systems

(1) The A1SD71 is only applicable to an A1SCPU module.
(2) The number of A1SD71 used with an A1SCPU module must be within the range of the number of $1 / O$ points of the A1SCPU.
(3) The A1SD71 can be installed in any two-slot area of a base unit, but the following must always be considered:
(a) If possible, avoid installing the A1SD71 in an extension base unit (A1S52B, A1S55B, A1S58B) not equipped with a power supply module, since the power supply capacity may be insufficient.
(b) If it is necessary to install the A1SD71 in an extension base unit which does not have a power supply module, select a power supply module, main and extension base units, and extension cables taking into consideration (a) the power supply capacity of the main base unit, and (b) the voltage drop across the main and extension base units and extension cables.
(See the A1SCPU User's Manual for details.)

### 2.3 Programming Equipment

The following table indicates the equipment available for programming the A1SD71.

Table 2.1 Programming Equipment

| Unit Division | Description | Type | Remarks |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Software package | SWOGP-AD71P | AD71(S1)/AD72/A1SD71 (S[ ]) software package |  |
| Programming unit | Intelligent GPP | A6GPPE-SET | - Consists of the following: |  |
|  |  |  | Type | Remarks |
|  |  |  | A6GPPE | - Programming unit with CRT <br> - Equipped with ROM writer, FDD and printer interface functions. |
|  |  |  | SW[ ]GP-GPPA | A series system disk |
|  |  |  | SWI IGP-GPPK | K series system disk |
|  |  |  | SWO-GPPU | User disk ( 3.5 inch, formatted) |
|  |  |  | AC30R4 | Cable for connecting A1SD71 and A6GPPE. |
|  | Plasma handy programmer | A6PHPE-SET | - Consists of the following: |  |
|  |  |  | Type | Remarks |
|  |  |  | A6PHPE | - Programming unit with plasma display <br> - Equipped with FDD, printer interface and memory cassette functions. |
|  |  |  | SWI IGP-GPPA | A series system disk |
|  |  |  | SW[ ]GP-GPPK | K series system disk |
|  |  |  | SWO-GPPU | User disk ( 3.5 inch, formatted) |
|  |  |  | AC30R4 | Cable for connecting A1SD71 and A6PHPE. $3 \mathrm{~m}(9.84 \mathrm{ft})$ length. |
|  |  | SWO-GPPU | Floppy disk ofr storing user programs ( 3.5 inch, formatted) |  |
|  | User disk | SWOS-USER |  |  |
|  | RS.422 cable | AC30R4 | Cable for connecting CPU and A6GPPE. 3 m ( 9.84 ft ) length. |  |
|  |  | AC300R4 | Cable for connecting CPU and A6GPPE. 30 m (98.4 ft) length. |  |
|  | Composite video cable | AC10MD | Cable for connecting GPP screen monitor display. 1 m ( 3.28 ft ) length. |  |
|  | Cleaning disk | SWO-FDC | Floppy disk for cleaning floppy disk drive. |  |
| Printer | Printer | K6PR(S1) | For print out of program ladder diagrams and lists. |  |
|  |  | K6PR-K |  |  |
|  |  | K7PR(S1) |  |  |
|  |  | A7PR |  |  |
|  |  | ATNPR |  |  |
|  | RS-232C cable | AC30R2 | Cable for connecting A6GPPE and printer (K6PR(S1), K6PR-K K7PR(S1), A7PR, A7NPR, general-purpose printer with RS-232C interface). 3 m ( 9.84 ft ) length. |  |
|  | Printer paper | K6PR-Y | Paper for K6PR and K6PR-K printer. 9 inch. Available in units of 2000 pcs. |  |
|  | $\begin{array}{\|l} \hline \begin{array}{l} \text { K6PR }(K) ~ i n k ~ \\ \text { ribbon } \end{array} \\ \hline \end{array}$ | K6PR-R | Replacement ink ribbon for K6PR and K6PR-K. |  |
|  | K6PR -K-SI ink ribbon | K6PR-K-SI | Replacement Ink ribbon for K6PR -K-SI |  |
|  | Teaching unit | AD71TU | AD71(S1)/AD72/A1SD71 teach box. |  |

## 3. SPECIFICATIONS

### 3.1 General Specifications

Table 3.1 General Specifications

| Item | Specifications |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Operating ambient temperature | 0 to $55^{\circ} \mathrm{C}$ |  |  |  |  |
| Storage ambient temperature | -20 to $75^{\circ} \mathrm{C}$ |  |  |  |  |
| Operating ambient humidity | 10 to $90 \% \mathrm{RH}$, non-condensing |  |  |  |  |
| Storage ambient humidity | 10 to $90 \% \mathrm{RH}$, non-condensing |  |  |  |  |
| Vibration resistance | $\begin{aligned} & \text { Conforms } \\ & \text { to } \\ & \text { *JISC0911 } \end{aligned}$ | Frequency | Acceleration | Amplitude | Sweep Count |
|  |  | 10 to 55 Hz | - | $\begin{gathered} 0.075 \mathrm{~mm} \\ (0.003 \text { inch }) \end{gathered}$ | $\begin{gathered} 10 \text { times } \\ * *(1 \text { octave/minute }) \end{gathered}$ |
|  |  | 55 to 150 Hz | $\begin{gathered} 9.8 \mathrm{~m} / \mathrm{s}^{2} \\ (1 \mathrm{~g}) \end{gathered}$ | - |  |
| Shock resistance | Conforms to *JIS C 0912 ( $98 \mathrm{~m} / \mathrm{s}^{2}(10 \mathrm{~g}) \times 3$ times in 3 directions) |  |  |  |  |
| Noise durability | By noise simulator of 1500 Vpp noise voltage, $1 \mu \mathrm{~s}$ noise width and 25 to 60 Hz noise frequency |  |  |  |  |
| Dielectric withstand voltage | 500 V AC for 1 minute across DC external terminals and ground 1500 V DC for 1 minute across $A C$ external terminals and ground |  |  |  |  |
| Insulation resistance | $5 \mathrm{M} \Omega$ or larger by 500 V DC insulation resistance tester across $A C$ external terminals and ground |  |  |  |  |
| Grounding | Class 3 grounding: If appropriate grounding is not available, connect the grounding wire to the electric panel. |  |  |  |  |
| Operating ambience | Free of corrosive gases. Dust should he minimal. |  |  |  |  |
| Cooling method | Self-cooling |  |  |  |  |

*JIS :Japanese Industrial Standard

## REMARK

One octave marked ** indicates a change from the initial frequency to double or half frequency. For example, any of the changes from 10 Hz to 20 Hz , from 20 Hz to 40 Hz , from 40 Hz to 20 Hz , and 20 Hz to 10 Hz are referred to as one octave.

### 3.2 Performance Specifications and Functions

### 3.2.1 Performance specifications

Table 3.2 Performance Specifications

| Item |  |  | Performances and Specifications |
| :---: | :---: | :---: | :---: |
| Number of l/O points |  |  | 48 points* (number of occupied slots : 2) |
| Number of control axes |  |  | 2 (simultaneous or independent) |
| Interpolation |  |  | Linear interpolation (for simultaneous 2 axes) |
| Positioning data |  | Capacity | 400 points per axis |
|  |  | Setting method | Input from peripheral device or sequence program |
| RAM memory backup |  |  | 15 minutes without battery ( $25^{\circ} \mathrm{C}$ ) <br> Lithium battery guarantees power failure backup for a total of 300 days. Battery guaranteed for five years. |
| Position ing | Method |  | Absolute and/or incremental method |
|  | Positioning units |  | 1 to 16,252,928 (PULSE) <br> Max. 162 (m) (command unit: 0.1 to $10 \mu \mathrm{~m} /$ PLS $)$ <br> Max. 16200 (inch) (command unit: $1 \times 10^{-5}$ to 0.001 inch/PLS) <br> Max. 16200 (degree) (command unit: $1 \times 10^{-5}$ to 0.001 degree/PLS) |
|  | Positioning speed |  | 10 to 200000 (PLS/sec) (command unit: $10 \mathrm{PLS} / \mathrm{sec}$ ) 10 to 120000 ( $\mathrm{mm} / \mathrm{min}$ ) (command unit: $10 \mathrm{~mm} / \mathrm{min}$ ) 1 to 12000 (inch/min) (command unit: $1 \mathrm{inch} / \mathrm{min}$ ) 1 to 12000 (degree/min) (command unit: 1 degree/min) |
|  | Acceleration and deceleration |  | Automatic trapezoidal acceleration and deceleration |
|  | Acceleration and deceleration times |  | 64 to 4999 (msec) |
|  | Backlash compensation |  | 0 to $65535 \times$ position command unit ( 0 to 255 pulses if unit is PULSE) |
|  | Error compensation |  | The A1SD71 may be calibrated to allow for mechanical errors in the positioning control mode and speed/positioning control switching mode. |
| Zero return |  |  | With zero address change function. Zero return direction and speed depend on setting. |
| Jog operation function |  |  | Jog operation by jog start signal input. |
| Inching function |  |  | Operation using manual pulse generator. |
| M function |  |  | M code output |
| Internal current consumption |  |  | 5 V DC, 0.8 A |
| External supply voltage, current |  |  | 4.75 to 26.4 V , max. 50 mA |
| Size mm (inch) |  |  | $130(\mathrm{H}) \times 69.5(\mathrm{~W}) \times 93.6(\mathrm{D})(5.12 \times 2.74 \times 3.69)$ |
| Weight kg (lb) |  |  | 0.38(0.84) |

## REMARK

* I/O allocation for the 2 slots are as follows:

First half slot ........Empty slot: 16 points
Second half slot ... Special-function module: 32 points
Section 6.1.1 gives details about the first half slot.

### 3.2.2 Functions

The A1SD71 has functions used for positioning and positioning control during two-axis independent operations and two-axis linear interpolation operations. These functions are utilized as follows:
$\left[\begin{array}{ll}\text { By test operation of a peripheral } \ldots . . . \begin{array}{l}\text { A peripheral device or AD71TU is } \\ \text { device or teaching unit } \\ \text { connected to an A1SD71, and posi- } \\ \text { tioning is executed using the periph- } \\ \text { eral device or AD71TU. }\end{array} \\ \begin{array}{l}\text { This is used during program checks or } \\ \text { test operations. }\end{array} \\ \text { By a sequence program ................ } \begin{array}{l}\text { Positioning is executed using a pro- } \\ \text { gram built in the PC CPU. }\end{array}\end{array}\right.$

For use of the peripheral device, refer to the SWOGP-AD71P Operating Manual. For use of the AD71TU, refer to the AD71TU Operating Manual. Positioning control functions are shown below.

| Function | Sequence Program or A6GPP |
| :--- | :--- |
|  | Two-axis independent <br> operation |
|  | Two-axis interpolation <br> operation |
| Set data read and write | An error code is provided by the A1SD71 if a data setting <br> or positioning control error occurs. <br> (For details of the error codes, refer to Chapter 8.) |
| Present value and speed <br> read | A1SDD71 set data (parameters, zero return data, <br> positioning data) can be read and written. |
| Present value data and speed data can be read from the <br> A1SD71. <br> (Present value can be read and monitored during <br> positioning.) |  |
| Teaching <br> (positioning data write) | After manual positioning, present value can be written as <br> position data. <br> (Data is written to both axes in the case of two-axes <br> interpolation operations.) |

The positioning functions of the A1SD71 are shown in Table 3.3.

Table 3.3 A1SD71 Positioning Functions

|  |  | Method with a eequence program or method(teat aperation) using a peripheral device (or AD71TU) |  |
| :---: | :---: | :---: | :---: |
|  |  | Two-exea Independent operation | Two-axee interpoletion operation |
| Inching operation function |  | The drive for the given axis is advanced by a predefined number of pulser each time a manual pulse is received. The manual pulse is provided by the manual pulse generator. | Unavailable |
| JOG operation function |  | JOG operations can be done when a JOG operation command from the PC CPU for peripheral device) is turned ON. | Unavaitable |
| Zero return |  | Returns by a zero return start command from the PC CPU (or peripheral device). The current value is corrected to the zero address after zero return is complated. | Unavailable |
|  | One-time positioning | Positioning is executed at a sot speed from the current position to the setting position. | Positioning is executed at a speed with two axes moving in linear directions from the current position to the setting position (linear interpolation). |
|  | n-times positioning | Changes speed in accordance with the positioning data set by a one-time start signal, and executes positioning. | Positioning by linear interpolation can be executed oontinuously at well as with the two-axis independent operation. |
|  | Positioning accompanied by a change in speed (pattern change) | Changes speed in accordance with the positioning data set by a one-time start signal, and executes positioning. | Unavailable |

Note)
(1) Error compensation and backlash compensation functions are valid for all the functions shown in Table 3.3.
(2) If positioning is done using a sequence program, a PC CPU can output the set M code from an A1SD71 when positioning starts or after positioning is completed. (Peripheral devices do not output $M$ codes during positioning.)
(3) Current values in an A1SD71 can be changed (rewritten) by a sequence program or peripheral device before positioning is started.
(4) Positioning can be done continuously by setting a positioning start data number to 20 points in the buffer memory ( $X$ axis: 0 to $39, Y$ axis: 300 to 339) in an A1SD71 before positioning starts in the postion control mode.

### 3.3 General Description of Positioning System Operations

This section gives a general description of the A1SD71 and its use in a positioning system.

### 3.3.1 Positioning system using an A1SD71

Fig. 3.1 shows the operation of an A1SD71 in a positioning system.

Fig. 3.1 Positioning System Operation Block Diagram
The A1SD71's output is a pulse string
When pulse strings are output, pulses are converted into error counters. Deviation counter pulse values are converted into $D C$ analog voltages by a D-A converter, and changed into speed commands.
The drive unit gives a speed command.
The motor begins to rotate and the pulse generator PG gives feedback pulses in proportion to the revolutions of the motor to subtract accumulated pulses.
The motor rotation continues maintaining the constant deviation counter pulse value.
When the command pulse output from the A1SD71 ceases, the deviation counter pulse value decreases, and the speed slows down.
Then, when the deviation counter pulse value becomes 0 , the motor stops. Thus, the motor's rotary speed is proportional to the frequency of the command pulse, and degree of the angle of the motor's rotation is proportional to the number of command pulse output pulses.
Therefore, transmission can be done to a position that is proportional to the number of pulses of a pulse string by specifying the feedrate per pulse.
The pulse frequency is equal to the number of revolutions (transmission speed) of the motor.

General design of positioning system

A : Position detection increment ( $\mathrm{mm} / \mathrm{p}$ )
Vs : Command pulse frequency ( $\mathrm{p} / \mathrm{s}$ )
n : Number of pulse generator slits (slits/rev)
L : Feed screw lead (mm/rev)
R : Reduction ratio
$V$ : Moving part speed ( $\mathrm{mm} / \mathrm{s}$ )
N : Motor speed (rpm)
$K$ : Position loop gain $\left(\mathrm{sec}^{-1}\right)$
e : Deviation counter pulse value
P0: Zero point (pulse)
P : Address (pulse)
(1) Position detection increment
$A=\frac{L}{R \times n}(\mathrm{~mm} / \mathrm{p})$
(2) Command pulse frequency
$V s=\frac{V}{A}(p / s)$
(3) Deviation counter pulse value
$\varepsilon=\frac{\mathrm{Vs}}{\mathrm{K}}$ (pulse)

Expression (1) indicates the travel per pulse, i.e. the number of output pulses $\times$ A. Using expression (2), calculate the command pulse frequency from the work speed and position detection increment. Expression (3) indicates the relation between the command pulse frequency and deviation counter pulse value.
Any of the four positioning units, (mm), (inch), (degree), and (PULSE), may be selected individually for the $X$ and $Y$ axes.
According to the target positioning address, a pulse string is output, and positioning is executed by the A1SD71 by setting data such as the travel distance and acceleration/deceleration time per pulse, the positioning speed, and the positioning address in a positioning command unit.

### 3.3.2 Signal communications between an A1SD71 and each unit

Fig. 3.2 shows a function block diagram for signal communications between each unit connected to an A1SD71, an A1SCPU, peripheral device, and the drive unit.

- Communication between PC CPU and A1SD71 Control signals and data communications via base unit, they consist of:
$\left[\begin{array}{l}\text { Control signals.....I/O signals given in Section 3.6. } \\ \text { Data...................Written to and read from the buffer memory by the PC }\end{array}\right.$ CPU. Detailed in Section 3.5.
- Communication between peripheral device (or AD71TU) and A1SD71 Data write, A1SD71 test, A1SD71 monitor, etc. via the A1SD71's RS-422 connector.
- Communications between drive unit and A1SD71 Control signal communication to and from the drive unit and pulse train output from the A1SD71. (For the I/O interface, refer to Section 3.7.)

- Indicates functions used to change the speed during A1SD71 positioning.

### 3.4 Types and Functions of Setting Data

- Setting data is data that is necessary for an A1SD71 to do positioning control. Setting data is the general term for the following three kinds of data:
Section 3.5 gives details about storing set data in the buffer memory.

Setting data is written using the following two methods:

1) By a peripheral device ....... The Operating Manual and the AD71TU or AD71TU Operating Manual SWOGP-AD71P give details.
2) By a sequence program ....... Section 6 gives details.

It is necessary to set data for two ( X and Y ) axes.

## POINTS

(1) All-clear data Before writing setting data, use a peripheral device to do allclear processing of the memory.
(2) Data setting when using either the $X$ or $Y$ axis When using either the $X$ or $Y$ axis, write parameter and zero return data to the axis not used.
$\left[\begin{array}{l}\text { Writing data must be a value in the setting range given in the } \\ \text { User's Manual. However, even if an initial value (default value) } \\ \text { is set by a parameter, there is no problem. }\end{array}\right]$
If zero return is done without writing data, an error occurs, and the error detection signal (X1B) goes ON.

### 3.4.1 Parameters

Parameters are the basic data which enable the A1SD71 to do positioning control. The data in Table 3.5 is contained in parameters.

- Initialization of parameters

If all parameters are not set or an error outside the setting range is detected by parameter checking, the A1SD71 will be controlled using the initial values shown in Table 3.5.
However, parameter area data remains as user-set values.
Parameters are checked when:

1) The power is turned $O N$;
2) Parameters are sent from a peripheral device to an A1SD71;
3) A PC CPU ready signal from the PC CPU to the A1SD71 switches from OFF to ON;
4) (1) zero return, (2) positioning, (3) jog operation, or (4) inching has been selected in the peripheral device or the AD71TU.
However, error code and error detection signals are not given for 1) above (power ON parameter check).

Table 3.5 Parameter Settings

|  |  | mm |  | Inch |  | degree |  | PULS(PLS) |  | Initial Values |  |

| 14 | Direction setting | 0 : Current value increase when forward pulse is output <br> 1: Current value increase when reverse pulse is output |  |  |  |  |  |  |  | Same as the previous setting | - |
| 15 | Positioning method | 0: Absolute <br> 1: Incremental <br> 2: Incremental/absolute combined |  |  |  |  |  |  |  | 0=absolute | - |
| 16 | $M$ code ON/OFF timing | 0: M code not used <br> 1: $M$ code used |  | 0 : WITH mado <br> 1: AFTER mode |  |  |  |  |  | Same as the previous setting | - |

*: Not fixed when shipped from the factory. All clear set to 0.

The actual parameter speed limit values and JOG speed limit values in Table 3.5 are multiplied by 6.1 (PLS/sec).

For example, the value that is nearest to 200 ( $\mathrm{PLS} / \mathrm{sec}$ ) is multiplied by 6.1 (PLS/sec), even if the speed limit value is set to 200 (PLS/sec).
$200 \div 6.1=32.78688 \ldots$. (Decimal point values are rounded off.)
The actual speed is $6.1 \times 32=195.2$ (PLS/sec).

## POINT

Numbers 2 to 12 show the setting range when setting with a sequence program.
However, parameters whose unit is $\times 10^{-1}$ or $\times 10^{1}$ are processed automatically as $\times 10^{-1}$ or $\times 10^{1}$ in the A1SD71 when processed with a value set in the program.
(Example) If the speed limit value is set to 200 , the value becomes $2000 \times 10^{1}=20000 \mathrm{~mm} / \mathrm{min}$ in the A1SD71.

Parameter data is explained as follows.
(1) Unit

Selects the units (mm, inch, degree, or pulse) for positioning control. Can be set independently for X and Y axes (e.g. X axis $=\mathrm{mm}, \mathrm{Y}$ axis =degree).
(2) Travel per pulse

- Specifies the travel distance per pulse as determined by the mechanics of the system.
- Controls the number of pulses contained in the pulse train from the A1SD71.
(3) Speed limit value
- Specifies the maximum speed for positioning (or zero return).
- When the positioning speed called at a given time is greater than the speed limit value, the speed is limited to the value set by the parameter.
- When a new speed is called during positioning by the sequence program and this is greater than the speed limit value, the speed is limited to the value set by the parameter.
(4) Jog speed limit value
- Specifies the maximum speed for jog operation.
- The jog speed limit value must be within the range shown in Table 3.5 and must not exceed the speed limit value.
- When the jog speed set using the peripheral device or sequence program is greater than the jog speed limit value, the jog speed is kept to the limit value.
- For jog operation, refer to Section 6.3.4.

## (5) Starting bias speed

- A minimum starting speed is required for the smooth operation of some motors (e.g. stepping motors). This may be set as a starting bias speed.
- The starting bias speed is used for positioning, jog operation, and zero return. See Fig. 3.3.

Fig. 3.3 Speed Change When Starting Bias Speed Is Set

For positioning with interpolation between axes, the starting bias speed set for the axis with the shorter distance to travel is ignored.
(6) Backlash compensation

- Allows a backlash compensation (see Fig, 3.4) to be programmed in for accurate positioning. Note that there is also an error compensation facility to allow for tolerances within the mechanical drive, see note (9).
- When backlash compensation is set, every time the travel direction changes during positioning, a feed pulse occurs which exceeds the backlash compensation amount.

During manual pulse generator inching, the pulse output begins as soon as the number of input pulses exceeds the backlash compensation amount each time the direction of movement changes. (If the inched distance is less than the backlash compensation, feed pulses will not be generated. However, the A1SD71 does calculate the subsequent positions according to the updated data).

- The feed pulse for a backlash compensation amount is generated by at least one JOG start signal during the JOG operation. Therefore, even if the travel distance is smaller than a backlash compensation amount, the feed pulse for a backlash compensation amount occurs.
- Backlash compensation is valid after zero return. After redefining the backlash compensation, always zero the system.

Fig. 3.4 Backlash Compensation

- For the backlash compensation amount, the range of the number of output pulses differs in accordance with the unit to be set in the parameter.

| Setting Units | Number of Output Pulses |
| :---: | :---: |
| PLS | 0 to 255 |
| mm |  |
| inch | 0 to 65535 |
| degree |  |

The * symbol indicates the value when the travel distance per pulse is set to 1 .
(7) Upper stroke limit

- Defines the upper limit value of machine travel.
- The stroke limit is checked before each positioning operation and if outside the allowed range, positioning is halted.
During jog operation and manual pulser inching, the stroke limit is ignored.
(8) Lower stroke limit
- Defines the lower limit value of machine travel.
- The stroke limit is checked before each positioning operation and if outside the allowed range, positioning is halted.
During jog operation and manual pulser inching, the stroke limit is ignored.
(9) Error compensatlon

When the set value and an actual feedrate differ, this is called error compensation.
When the unit is mm , an error compensation per $m$ (per 100 inches if the unit is inches and per 100 degrees if the unit is degrees) is set to 0 , and the feedrate of any set value is transmitted. (Automatic start) Then, the actual feedrate $(A)$ is measured, and the error compensation amount and backlash compensation amount are calculated as indicated below.

- When the unit is mm

Error compensation amount $\left(10^{-1} \mu \mathrm{~m}\right)=\left(\frac{\text { Set value }(\mathrm{mm})}{\mathrm{A}(\mathrm{mm})}-1\right) \times 10^{7}$

- When the unit is inches

Error compensation amount $\left(10^{-5}\right.$ inch $)=\left(\frac{\text { Set value(inch })}{A(\text { inch })}-1\right) \times 10^{7}$

- When a unit is degrees

Error compensation amount $\left(10^{-5}\right.$ degree $)=\left(\frac{\text { Set value(degree })}{A(\text { degree })}-1\right) \times 10^{7}$

- Set the numerical value calculated in the following expression as the backlash compensation amount when there is a machine error.
Backlash compensation $=$ Backlash compensation actual value $\times \frac{\text { Set value }}{A}$
(10) Manual pulser inching travel increment
- Defines the distance travelled each time a manual pulser inching command is given.
- The A1SD71 counts the number of manual pulse inching command inputs and transmits the appropriate number of output pulses. (The applicable output speed range is 10 to 20000 PLS(unit $=10 \mathrm{PLS} / \mathrm{sec}$.). See section 3.5.
(11) Acceleration and deceleration times
- Defines the period of time from the start of positioning to when the speed limit value specified in the parameter is reached. (Refer to Fig. 3.5.)

Fig. 3.5 Acceleration and Deceleration Times

- The acceleration time is the same as the deceleration time. They cannot be set differently.
- The acceleration and deceleration are controlled at a constant value.
- When the positioning speed is lower than the parameter speed limit, the acceleration and deceleration times are comparatively ahort.
Therefore, the maximum positioning speed must be either equal to the parameter speed limit or an approximate value.
- The acceleration and deceleration times are valid for zero return, positioning, and jog operations.
- For interpolation positioning, the acceleration and deceleration times for a master axis are valid. (The acceleration ane deceleration times for a slave axis are ignored.)
(12) Positioning complete signal duration

Sets the duration of the "positioning complete signal" from the A1SD71. Positioning is considered to be complete after the A1SD71 terminates pulse output and the predetermined dwell time has elapsed.
(13) Pulse output mode

Defines the output mode as A type or B type.

- Forward pulse or reverse pulse, two pulse chains.

| Forward feed pulse PULSEF | PULSEF - $\longrightarrow \square \square \square$ | A type |
| :---: | :---: | :---: |
| Reverse feed pulse PJLSER | PULSER $\longrightarrow$ T円ワT |  |

- PLS + SIGN

(14) Direction setting

Selects the direction for which the present value increases. (Set 0 when using forward pulse output. Set 1 when using reverse pulse output.) Positioning and zero return follow this direction of rotation.
(15) Positioning mode

- Specifies incremental, absolute, or incremental/absolute combination modes for positioning.
- In incremental mode positioning, positions are reached with reference to the previous position. (See Fig. 3.6.)

Fig. 3.6 Incremental Method

- In absolute mode positioning, positions are reached with reference to a Zero point address. (See Fig. 3.7.)

Fig. 3.7 Absolute Method

- To use both incremental and absolute modes in the same axis (e.g. X axis), set 2 . In this case, the mode is controlled by the individual piece of positioning data. (Refer to Section 3.4.3.)
(16) M code ON/OFF timing

M codes are code numbers ( 1 to 255 ) assigned by the user to control auxiliary functions (for example, clamp, drill rotation, stop, and tool exchange commands, etc.) at defined points in the positioning cycle. These are used by the PC CPU to co-ordinate the operation of external equipment and processes:

- M code use/non-use must be specified as well as where in the positioning sequence they are to be used.
When $M$ code non-use is specified or peripheral device test mode is in operation, $M$ code data in the buffer memory is cleared and the " M code ON" signal is not output.
- When the M code used is specified, the output timing of the M code ON signal must be specified.
- "M code ON" signal output is available in two timing modes, WITH and AFTER.
(a) WITH mode

The " M code ON " signal is given at approximately the same time as the positioning operation starts.

Fig. 3.8 WITH Mode Signal Timing

## (b) AFTER mode

The "M code ON" signal is given after the positioning operation has finished. In this mode, if the operation is stopped before it is complete the " M code $\mathrm{ON}^{\prime}$ signal is not given.

Fig. 3.9 AFTER Mode Signal Timing

## POINTS

- The "M code ON" signal is not given if the $M$ code data in the positioning data is set at 0 .
- The $M$ code is ignored if the positioning pattern is " 11 " and the " $M$ code ON" signal is not given. (For details of the positioning pattern, refer to Section 3.4.3.)
The next positioning operation is not started until the "M code ON" signal is switched off. An error condition arises if the "M code ON" signal is on at the rise of the start signal and positioning is not started. The "M code ON" signal is turned off when:

1. "M code OFF" signal changes from OFF to ON;
2. PC ready signal (Y2D) is OFF; or
3. Zero return, positioning, jog operation, or inching mode is selected in the peripheral device or the AD71TU test mode.

When positioning processing beginning with pattern 11 is executed, the M code ON signal goes ON when positioning processing of pattern 00 or pattern 01 begins in the WITH mode or when completed in the AFTER mode.

The M code is set before pattern 11 positioning processing begins.

Fig. 3.10 "M Code ON" Signal Timing for Positioning Pattern "11"

## REMARK

Fig. 3.10 shows the $M$ code ON signals in the WITH mode and the AFTER mode. However, this is only to explain the $M$ code ON signal, and either (WITH mode or AFTER mode) can actually be used.

### 3.4.2 Zero return data

This defines a home position or zero point for the A1SD71. Refer to Table 3.6. Zero return data is checked when:

1) Parameters or zero return data is transferred from the peripheral device to the A1SD71;
2) "PC ready signal" output from the PC CPU to the A1SD71 changes from OFF to ON; or
3) Zero return, positioning, jog operation, or manual pulser inching is selected in the peripheral device test mode.

Table 3.6 Zero Return Data

|  |  | mm |  | inch |  | degree |  | PULSE |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Sotting rango | Unit | seting range | Unit | Setting range | Unit | Selting range | Unit |
| 1 | Zero return direction | 0 : Forward direction (address increases) <br> 1 : Reverse direction (address decreases) |  |  |  |  |  |  |  |
| 2 | Zero return method | 0 : Pulse generator(PG)zero-point signal <br> 1 : Stopper stop (1) and dwell timer time-out <br> 2 : Stopper stop (2) and signal from drive unit |  |  |  |  |  |  |  |
| 3 | Zero return address | $\begin{aligned} & 0 \text { to } \\ & 162 \times 10^{7} \end{aligned}$ | $\times 10^{-1} \mu \mathrm{~m}$ | $\begin{aligned} & 0 \text { to } \\ & 162 \times 10^{7} \end{aligned}$ | $\times 10^{-5}$ inch | $\begin{aligned} & 0 \text { to } \\ & 162 \times 10^{7} \end{aligned}$ | $\times 10^{-5} \mathrm{deg}$ | $\begin{aligned} & 0 \text { to } \\ & 16252928 \end{aligned}$ | PLS |
| 4 | Zero return speed | 1 to12000 | $\begin{aligned} & \times 10^{1} \\ & \mathrm{~mm} / \mathrm{min} \end{aligned}$ | 1 to12000 | $\times 1$ inch/min | 1 to 12000 | $\times 1$ deg/min | 1 to 12000 | $\begin{array}{\|l\|} \times 10^{1} \\ \text { PLS/sec } \end{array}$ |
| 5 | Creep speed | 1 to12000 | $\times 10^{1}$ $\mathrm{mm} / \mathrm{min}$ | 12012000 | $\times 1$ inch/min | 1 to12000 | $\times 1$ deg/min | 1 t012000 | $\begin{aligned} & \times 10^{1} \\ & \text { PLS/sec } \end{aligned}$ |
| 6 | Zero return dwell time | 0 to 499( $\times 10^{1} \mathrm{msec}$ ) |  |  |  |  |  |  |  |
| 7 | Torque limit | 10 to 250(\%) |  |  |  |  |  |  |  |

## POINTS

(1) No. 3 to No. 7 can be set by the sequence program.
(2) Setting numbers " 0 and 1 " of the zero return direction and setting numbers " 0,1 , and 2 " of the zero return method are numbers set by a peripheral device.
When setting No. 1 and No. 2 from the sequence program, refer to Section 3.5.7.

## REMARK

The zero return speed and creep speed in Table 3.6 are multiplied by 6.1 ( $\mathrm{PLS} / \mathrm{sec}$ ).
For example, the value that is nearest to 200 ( $\mathrm{PLS} / \mathrm{sec}$ ) is multiplied by 6.1 ( $\mathrm{PLS} / \mathrm{sec}$ ), even if the speed limit value is set to 200 (PLS/sec). (Decimal point values are rounded off.)
$200+6.1=32.78688 \ldots$.
The actual speed is $6.1 \times 32=195.2$ (PLS/sec)

Zero return data is explained below:
(1) Zero return direction - Specifies the direction for zero return.

## IMPORTANT

Zero return is controlled according to the zero return direction and speed. Deceleration is started when an actuator is operated. Always ensure that the zero return direction is correct for the drive system used.
(2) Zero return methods

There are three kinds of zero return methods:

- The pulse generator (PG) zero-phase signal method
- Mechanical stop (1) (caused by dwell timer time)
- Mechanical stop (2) (caused by a signal from the drive unit)
(a) Method by the pulse generator (PG) zero-phase signal method This method of stopping by a zero-phase signal from the PG is shown in Fig. 3.11.
A PG with a zero-phase signal is necessary. (Refer to Fig. 3.12.)

Fig. 3.11 Zero Return Using a PC CPU Zero-Phase Signal

Fig. 3.12 Feedback Pulse Pattern
(b) Mechanical stop (1) (caused by a dwell time time-out) Atter a near-point dog has operated and the dwell time has passed, zero return is completed. (Refer to Fig. 3.13-1.)
In this case, if the dwell time has not passed, even if the near-point dog goes OFF halfway, zero return is not completed. After reaching the creep speed, limit the servo motor torque (Section 3.4.2(7) gives details).
If the servo motor torque is not limited, the servo motor may malfunction when a stopper is hit.

Fig. 3.13-1 Zero Return by Using Stopper Stop (1)
(c) Mechanical stop (2) (caused by an external stop command)

This is the method of stopping by inputting an external stop command when a servo motor interferes with the stopper. (Refer to Fig. 3.13-2.)

Forcibly input a zero-phase signal (stop command) to the zero-phase signal terminal by an external switch after the near-point dog goes ON.
When inputting a zero-phase signal (stop command), the ON/OFF state of the near-point dog is not a problem.
After reaching the creep speed, limit the servo motor torque (Section 3.4 .2 (7) gives details).

If the servo motor torque is not limited, the servo motor may malfunction when a stopper is hit.

Fig. 3.13-2 Zero Return Using a Stopper

## REMARK

If a stop signal is input before the speed decelerates to the creep speed, excessive power is delivered to the servo motor and machine system, causing a fault.
(3) Zero return address

- This address is set as the present value of the home position upon completion of zero return.
- Set the zero return address to either the upper or lower stroke limit set in the parameters.
(4) Zero return speed
- Sets the zero return speed. (Refer to Fig. 3.14.)
(5) Creep speed
- The creep speed is low-speed until stopped after decelerating from the zero return speed by the zero return point dog being ON during zero return. (Refer to Fig. 3.14.)
- The creep speed varies according to the detected error in the case of zero return by a zero-phase signal and to the size of an impact during collision in the case of zero return by stopper.
Therefore, set the creep speed taking the error range and the size of an impact into consideration.

Zero return speed starts deceleration.

Drift (according to drive unit)

Zero-phase signal
Adjust the actuator so that its OFF position is near the center of the zero-phase signal.

Torque limit valid range

Fig. 3.14 Zero Return and Creep Speeds
(6) Zero return dwell time

- The zero return dwell time is the time until zero return is completed after the near-point dog goes ON during zero return by stopper stop (1).
- Set the time until stopping by the stopper after the zero return speed decelerates to the creep speed.
- Even if any value (in the setting range) is input at the time other than stopper stop (1), there is no problem.

## (7) Torque limit

This is the set value to limit the torque of a servo motor after reaching the creep speed when doing a zero return.

## POINTS

- A D-A converter is necessary for torque limit.
- Be sure to set it when doing a zero return operation by stopper stop (2).
- Even if any value (in the setting range) is input when torque is not limited, there is no problem.

Fig. 3.15 Torque Limit Block Diagram

### 3.4.3 Positioning data

Positioning data is used in the A1SD71 to execute positioning control (i.e. control other than zero return, inching and jog operation). Refer to Table 3.7. Table 3.7 shows one block of positioning data. 400 blocks can be set for the $X$ and $Y$ axes, respectively.
The block of data used for positioning is dictated by the number set in the positioning start area of the buffer memory.
Positioning data is checked when positioning is started.
Table 3.7 Positioning Data List

|  |  | Setting Data |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Positioning information | b15 |  |  |  | in pattern ositioning ositioning peed chan <br> ing metho solute remental ly when in in param <br> in direction ward dire verse dire <br> (may be 0 <br> (0 to 255) de $=0 \mathrm{wh}$ | rminated ntinued od and pos <br> emental/ab er. <br> (valid in inc on (addres ion (addres <br> 1) | ioning the <br> olute com <br> emental m increase) decrease <br> not specifi | continued <br> nation is <br> de only) |
|  |  | mm |  | inch |  | degree |  | PULS |  |
|  |  | Setting range | Unit | Setting range | Unit | Setting range | Unit | Setting range | Unit |

| 4 | Dwell time | $010499\left(\times 10^{1} \mathrm{msec}\right)$ |  |  |  |  |  |  |  |

## POINT

No. 2 to No. 4 can be set from the sequence program.

The data to be set as positioning data is explained below.
(1) Positioning information

- Separate the information for the $X$ and $Y$ axes.
- Positioning information consists of 16 bits and includes the following.

(a) Positioning pattern

Specifies positioning completion in accordance with the positioning data that corresponds to the data number or positioning continuation by the next data number by using the positioning pattern.
The positioning continuation pattern is as follows:

1) Positioning is completed in accordance with the specified address, and positioning is continued by the next data number (positioning address).
2) Positioning is continued after changing speed at the specified address.
Fig. 3.16 shows how to specify bits in the buffer memory to specify the positioning pattern.

This pattern data is specified by the first two bits of the positioning information.

Fig. 3.16 Positioning Pattern

- Positioning end

Drives to the specified address, positioning is complete after the dwell time has elapsed.

Fig. 3.17 Pattern 00

- Positioning continued

The positions are reached consecutively in the order specified by their data numbers by a single start signal. (The BUSY signal remains on during positioning.)

Fig. 3.18 Pattern 01

## POINT

Pattern 00 should be set for the last position in a series of continuous operations.
Pattern 01 may be set for interpolation positioning. In this case, the patterns for the $X$ and $Y$ axes should be the same. The $X$ and $Y$ axis patterns are checked before operation and any error will stop positioning.

- Positioning continues with speed change

The positions are reached consecutively in the order specified by their data numbers by a single start signal. During positioning, the speed may be changed but the direction remains the same. (Refer to Fig. 3.19.)

Fig. 3.19 Pattern 11

Table 3.8 shows the positioning data for Fig. 3.19. The following conditions apply:

M code ON/OFF timing : AFTER mode
Incremental/absolute method : Incremental and absolute combined

Table 3.8 Positioning Data

|  | Data No. | Pattern | Speed | Address | Dwell | Method | M code |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $X$ axis | 100 | 11 | $V_{1}$ | $\mathrm{P}_{1}$ | - | Abs. | 0 |
|  | 101 | 11 | $\mathrm{V}_{2}$ | $\mathrm{P}_{2}$ | - | Abs. | 0 |
|  | 102 | 01 | $V_{3}$ | P3 | t 3 | Ahs. | 0 |
|  | 103 | 00 | $V_{4}$ | $\mathrm{P}_{4}$ | $t 4$ | Inc. | 5 |
|  | 104 |  |  |  |  |  |  |
|  | 105 |  |  |  |  |  |  |
|  | 106 |  |  |  |  |  |  |
|  | 107 |  |  |  |  |  |  |
|  | 108 |  |  |  |  |  |  |

In the method column, Abs. indicates absolute method and inc. incremental method.

## POINTS

(1) For continuous positioning, pattern 11 should not be used more than nine times consecutively. Where a large number of consecutive 11 patterns are being used, they must be broken down by placing 01 pattern data every nine 11 patterns. (e.g. pattern $11=9$ times, pattern $01=1$ time, pattern $11=9$ times, pattern $00=1$ time).
(2) Always set pattern 00 in the final data block.
(3) While pattern 11 is continuing, the direction of movement and the positioning method should remain unchanged, only after pattern 01 or 00 may these be changed. If the speed is changed after deceleration has started, the new speed is ignored and, if the $M$ code has been set in WITH mode, the "M code ON" signal is not given.
(4) During positioning using pattern 11 , dwell time data and $M$ code will be ignored.
(5) Interpolation positioning cannot be specified when pattern 11 is being used.
(b) Positioning methods

The positioning method specified in positioning data becomes valid only when a parameter positioning method was specified to use both incremental and absolute mode positioning.
(If the parameter positioning method is not specified to use both incremental and absolute mode positioning, the specification of the positioning method in positioning data is ignored, and the positioning method follows the setting in the parameter.)

## POINT

While pattern 11 is continuous, positioning methods cannot be changed.
When use of both incremental and absolute mode positioning is specified, positioning methods can be changed after pattern 00 or pattern 01.
(c) Positioning direction

- For incremental mode positioning, the direction of travel relative to the previous address must be specified. (0 specifies forward, increasing address numbers and 1 specifies reverse, decreasing address numbers.)
In absolute mode, the positioning direction is ignored.
(d) M code

Specifies an "M" code relevant to that position address. (range: 0 to 255)

The code should be set to 0 if it is not required.
During interpolation positioning, $M$ codes are given individually for the $X$ and $Y$ axes. ( $X$-axis $M$ code, buffer address $=46$. $Y$-axis $M$ code, buffer address $=346$.)
(2) Positioning speed

Specifies the speed at which the next position is to be approached.

## POINTS

(1) Before operation, the parameter speed limit is checked and if the positioning speed exceeds the speed limit value, the parameter speed timit value is used.
(2) In the case of linear interpolation, the setting speed of the axis whose travel distance is smaller is ignored.
Therefore, when the combination of travel distance and speed differs greatly between the $X$ and $Y$ axes, the travel speed of either $X$ or $Y$ may be larger than the setting speed. (The speed limit value is ignored.)
In the same case of linear interpolation, Mitsubishi recommends setting the same speed and speed limit value to both the $X$ and $Y$ axes.

Positioning speed for linear interpolation
During linear interpolation positioning, the speed set for the axis with the furthest to travel takes precedence and the speed of the other axis is derived as follows.
(Short travel axis speed)
$=\left(\right.$ long travel axis speed) $\times \frac{\text { (short travel distance) }}{\text { (long travel distance) }}$
An example of this is given in Fig. 3.20 which uses the following data:

|  | XAxis | Y Axis |
| :--- | :--- | :--- |
| Parameter set value $:$ speed limit value | $20 \mathrm{KPLS} / \mathrm{sec}$ | $50 \mathrm{KPLS} / \mathrm{sec}$ |
| Positioning data set value : positioning speed | $20 \mathrm{KPLS} / \mathrm{sec}$ | $50 \mathrm{KPLS} / \mathrm{sec}$ |

To move from point $A$ (address 0,0$)$ to point $B(100 \mathrm{kp}, 200 \mathrm{kp}), \mathrm{X}$-axis travel is less than Y -axis travel so $\mathrm{Vy}=50 \mathrm{kp} / \mathrm{s}$ has precedence.
$X$-axis positioning speed $=50 \times \frac{100}{200}=25 \mathrm{KPLS} / \mathrm{sec}$
(This speed exceeds the speed limit value which is ignored in this case.)

Fig. 3.20 Linear Interpolation
Note)
In case of interpolation positioning, the actual positioning speed is approx. $5 \%$ slower than the set speed.
When the set speed is too slow, the error range becomes large.
Example: When 100 PPS is set, the error range becomes approx. $10 \%$ large.

## REMARK

Positioning speeds are multiplied by 6.1 (PLS/sec).
For example, when a positioning speed is 200 ( $\mathrm{PLS} / \mathrm{sec}$ ), the maximum speed to be output from A1SD71 is as follows:
$200=6.1 \times n \ldots . . n=32.7868 \ldots$.
Therefore, the maximum speed is $6.1 \times 32=195.2$ (PLS/sec).
(3) Positioning address

Set the positioning address in accordance with the positioning method.

- When using the incremental method, set the travel distance. When using the absolute method, set the address value.
(4) Dwell time

The dwell time is the period of time indicated in Fig. 3.21 below.

Fig. 3.21 Pattern 00
During interpolation positioning, the longer dwell time value is valid irrespective of the distance travelled (e.g. if $X$ axis $=1 \mathrm{sec}$ and $Y$ axis= $1.5 \mathrm{sec}, 1.5 \mathrm{sec}$ is valid.)

### 3.5 Buffer Memory

The A1SD71 has a battery backed buffer memory for communication of data with the A1SCPU. The memory map is shown in Fig. 3.28.
Data can be read from the buffer memory as follows:

- Reading data using the sequence program

One word (16 bit) or two word data can be read by using the buffer read application instructions.

- Reading data using the peripheral device

Data can be read in the various modes of a peripheral device.
For details, refer to the SWOGP-A1SD71P Operating Manual.
Data can be written to the buffer memory as follows:
(The writing of data may be restricted depending on the status of the A1SD71. General write conditions are shown in Fig. 3.28. For further details, refer to Section 3.5.1 to 3.5.5.)

- Writing data from the sequence program

One word (16 bit) or two word data can be written by using the buffer write application instructions.

- Writing data from the peripheral device

Data can be written by storing data to a memory area in the peripheral device and transferring data in blocks from the peripheral device to the A1SD71 buffer memory.
One word (16 bit) or two word data can be written to the A1SD71 buffer memory by using the AD71TU .

An additional function allows individual pieces of positioning data to be written to the buffer memory if the A1SD71 is busy. For details, refer to the SW0GP. AD71P Operating Manual.

## REMARK

Fig. 3.22 Buffer Memory Map

### 3.5.1 Positioning start data

The positioning start data area is shown in Fig. 3.23. The arrangement of the data is the same for both $X$ and $Y$ axes, only addresses are different.

## POINT

Both the X -axis and Y -axis BUSY signals must be off to write this data into the A1SD71 from the peripheral device.

Fig. 3.23 Positioning Start Data Area
(1) Speed change area ( $X$ axis :address 40, $Y$ axis :address 340)

To change the speed of traverse during positioning, jog operation or zero return, write the new speeds to these addresses. (To be within the range shown in Table 3.7) This data overrides the speed set in the positioning data. Speed change is illustrated in Fig. 3.24 below.

Fig. 3.24 Speed Change Example

## POINT

Acceleration and deceleration cycles use the positioning data speed regardless of any forced speed change.
The speed cannot be force changed under the following circumstances:

- after a deceleration start point;
- in inching mode;
- after a stop command or after the jog signal is turned off; or.
- during interpolation positioning
(2) Present value change area
( $X$ axis :address $41,42, Y$ axis :address 341,342 )
To change the present value data in the A1SD71, write the new value to these addresses.

## POINT

The present value cannot be changed while the A1SD71 is BUSY. Present value data is two words long, one word data cannot be written.
(3) Jog speed area ( $X$ axis :address 44, $Y$ axis :address 344)

Specify the jog speed by writing speed data to these addresses. This data may be written at any time.
JOG speed data set when the JOG start becomes valid.
(4) Manual pulser inching enable area (X axis:address 47, $Y$ axis:address 347)

Enable the manual pulser inching function by writing a 1 to the least significant bit in this address. This data may be written at any time. (Refer to Fig. 3.25.)

Fig. 3.25 Manual Pulser Inching Enable Area
(5) $M$ code comment area ( $X$ axis :address 49 to 200, $Y$ axis :349 to 500) Up to 16 ASCII characters may be entered as $M$ code comment data (using the peripheral device or sequence program).
Comments may be written to M code numbers 1 to 19 for both X and Y axes.
How to use:

1) Monitoring by a peripheral device
2) Reading using a sequence program, and displaying it externally.
(6) Status area ( $X$ axis :address 43, $Y$ axis :address 343)

Is reserved for the information shown in Fig. 3.26 and is set by the A1SD71 OS.

Fig. 3.26 Status Area

## POINT

Do not write data to this area.
(7) Error code area ( $X$ axis :address $45, Y$ axis :address 345 )

The code number of any error detected by the A1SD71 is written to these addresses by the OS. Use in conjunction with the error detection signal (X1B).

## POINTS

- The error code area is used by the A1SD71 OS and data must not be written here.
- The most recent error code is written to this area. The absence of any error is indicated by a " 0 " in this address.
It takes 20 to 30 msec to set an error code after outputting an error detection signal (X1B).
- For error codes, refer to Chapter 8.
(8) $M$ code area ( $X$ axis :address 46, $Y$ axis :address 346)

The "M code" specified in the positioning data for the current positioning operation is written to these addresses. The $M$ code number can be used to co-ordinate external equipment and processes.

Fig. 3.27 M Code Area

## POINTS

- Do not write data to these addresses.
- For M code data timing details, refer to Section 3.4.1 (16).
(9) Current data number area ( $X$ axis :address 48, $Y$ axis :address 348)

The number of the positioning data block currently being processed is written to these addresses by the A1SD71 OS. This number is retained until the next positioning operation begins. (Refer to Fig. 3.28.)

Fig. 3.28 Current Data No. Update Timing

## POINT

Do not write data to these addresses.
(10) Start data number area ( X axis :address $0, Y$ axis :address 300)

Positioning is executed sequentially by data number using a one-time start signal in the positioning control mode, and positioning operations are completed by positioning END of positioning pattern 00.
To execute the previously mentioned series of positioning operations continuously, the first data number (start data number) and the start axis of the positioning operation series are registered. This area is called a start data number area.
A start data number area with a maximum of 20 points can be set as shown in Fig. 3.29.

Fig. 3.29 Start Data Number Area

## POINTS

- When positioning of the start data number of the 20th point is completed, positioning is completed even if the value of a pointer is not 0 (however, an error code is set).
- The BUSY signal remains ON during switching to the next point after positioning of the 1st point has been completed.
(a) Start axis area details

Use the two least significant bits of these addresses to define the start axis. (See Fig. 3.30.)

b2 to b15 may be 1 or 0 (ignored by OS).

$$
00 \text { :Interpolation start }
$$

01 :X axis start
10 :Y axis start
11 :Both-axes start (No interpolation)

Fig. 3.30 Start Axis Area
The following occurs if both axes are started and an error is found in one:

1) Both axes stop if the error has occurred between consecutive positions.
2) Only the axis with the error stops if the error occurred after both axes have started.
(b) Data setting precautions
3) When both axes are to be started together (i.e. interpolation setting 00 or independent setting 11) ensure that the start axis data matches for both $X$ and $Y$ axes at that point. Processing will stop if the data does not match. Refer to Fig. 3.31.

In the above example,
$X$ axis

| 2nd | point | Interpolation start |
| :--- | :--- | :---: |
| 3rd | point | Both-axes start |
| 4th | point | $X$ axis start |

Y axis
Interpolation start $\rightarrow$ OK Both-axes start $\rightarrow$ OK
Interpolation start $\rightarrow$ Error
When positioning is switched to the 4th point, an error occurs with the $Y$ axis and positioning of the $Y$ axis is stopped.

Fig. 3.31 Start Data Example 1
2) If the start axis in the $X$-axis start data number area is set at the $Y$ axis (10), the point data is ignored (positioning is not executed) and the next point is processed. (Refer to Fig. 3.32.) If the start axis in the $Y$-axis start data number area is set at the $X$ axis (01), the next point is processed.

If the 2nd and 3rd points of the $X$ axis are set to the $Y$ axis (10) as shown above, the $2 n d$ and 3 rd points are ignored and the positioning of the 4 th point is processed.
The 3rd point is ignored, and positioning is switched to the 4th point because the 3rd point of the $Y$ axis is set at the $X$ axis (01).

Fig. 3.32 Start Data Example 2
3) When the start axis is set to interpolation start (00) or both-axes start (11) and the other axis is not set to BUSY, the other axis starts positioning automatically using the start data number set at the point that is the same as its own axis (refer to Fig. 3.33). If the $M$ code $O N$ signal of the other axis goes $O N$ at this time, an error occurs.

Fig. 3.33 Start Data Example 3
4) Processing will stop if interpolation (00) or independent (11) operations have been called and the other axis is under different control (e.g. zero return jog operation or inching).
(See Fig. 3.34)

It is assumed that the X -axis start signal goes ON , and X -axis positioning processing is executed.
The X axis does not start interpolation positioning if the Y axis is performing zero return, a JOG operation, or BUSY using a manual pulse generator when positioning of the $X$ axis is switched to the 3rd point. Then, an error is registered, and positioning processing is stopped.

Fig. 3.34 Start Data Example 4
5) In a situation where interpolation (00) or independent (11) start has been defined at one axis and the other axis is still positioning, processing will vary as described below.

- An axis will wait for the other to finish its current process or for its busy signal to turn off. This is illustrated in Fig. 3.35 below.

Fig. 3.35 Start Data Example 5

- Processing will stop if one axis proceeds ahead of the other and dual axis processing is called. See Fig. 3.36.

Fig. 3.36 Start Data Example 6

### 3.5.2 Error reset (Address 201)

The error codes for both axes can be reset by writing a I to the least significant bit of this address. This also resets the error detection signal X1B.
The OS then acknowledges that error signals have been reset by writing a 0 to this bit.

Fig. 3.37 Error Reset Area Details

### 3.5.3 Inching output speed area (X axis: address 202, Y axis: address 502)

Specifies the output speed during inching operation.
The speed is specified in this area for positioning using the inching operation.
(1) The applicable output speed range is 10 to 20000 PLS (unit: 10 PLS/sec).
(2) Sets a tenth of the operation speed to be executed. Ex.) When the inching operation is to be executed at 2000 PLS/sec, set to " 200 ".
(3) Output speed data cannot be written using the peripheral device.
(4) Output speed data is written via the user's PC program at any time. However, the data becomes available when the BUSY signal switches from OFF to ON.

### 3.5.4 OS data area (Addresses 512 to 767)

Addresses 512 to 767 are used by OS. The user cannot write data in this area.
Data shown in Fig. 3.38 can be read and used with a sequence program.
(Section 6.3.2 gives details about the reading method.)

Fig. 3.38 OS Data Area

### 3.5.5 Positioning data area ( $X$ axis :address 3872 to 5871, $Y$ axis :address 5872 to 7871)

This area stores the positioning data explained in Section 3.4.3. The positioning data consists of positioning information, positioning speed, dwell time, and positioning address as shown in Fig. 3.39. For the conversion of expressions from a data number to a buffer memory address, refer to the next page. As an example, for $X$ axis data number $=2$, data is stored in the following areas:

Positioning information:Address $=3873$
Positioning speed :Address $=4273$
Dwell time :Address $=4673$
Positioning address :Address $=5074$ (lower 16 bits),
5075 (upper 16 bits)

Fig. 3.39 Positioning Data Area

## Method of converting from a data number to the buffer memory address

When using a sequence program to set positioning data that corresponds to data numbers, convert data numbers into a buffer memory address by the following:

|  | X Axis | Y Axis |
| :---: | :---: | :---: |
| Positioning information | $A=3872+(\text { data No. }-1)$ or $A=3871+$ (data No.) | $A=5872+\text { (data No. }-1)$ or $A=5871$ + (data No.) |
| Positioning speed | $\begin{aligned} A & =4272+(\text { data No. }-1) \\ \text { or } A & =4271+(\text { data No. }) \end{aligned}$ | $A=6272+(\text { data No. }-1)$ or $A=6271$ + (data No.) |
| Dwell time | $A=4672+$ (data No. - 1) or $A=4671+$ (data No.) | $A=6672+(\text { data No. }-1)$ or $A=6671$ + (data No.) |
| Positioning address | $\begin{aligned} & \text { Lower } 16 \text { bits } \\ & \left.A_{2}=5072+\text { (data No. }-1\right) \times 2 \\ & \text { or } A_{2}=5070+\text { (data No.) } \times 2 \end{aligned}$ | $\begin{aligned} & \text { Lower } 16 \text { bits } \\ & A_{2}=7072+(\text { data No. }-1) \times 2 \\ & \text { or } A_{2}=7070+(\text { data No. }) \times 2 \end{aligned}$ |
|  | Upper 16 bits $A_{1}=A_{2}+1$ | $\begin{aligned} & \text { Upper } 16 \text { bits } \\ & \qquad A_{1}=A_{2}+1 \end{aligned}$ |

## REMARK

A conversion table is given in Appendix 5.

### 3.5.6 Parameter area ( X axis :address 7872 to $\mathbf{7 8 8 7}, \mathrm{Y}$ axis :address 7892 to $\mathbf{7 9 0 7}$ )

Stores the parameters described in Section 3.4.1.
See Fig. 3.40.

Fig. 3.40 Parameter Area

## 3. SPECIFICATIONS

MELSEC-A

### 3.5.7 Zero return data area ( $X$ axis :address 7912 to 7918, Y axis :address 7922 to 7928)

Stores Zero return data described in Section 3.4.2.
See Fig. 3.41.

Fig. 3.41 Zero Return Data Area

### 3.6 I/O Signals To and From A1S CPU

The A1SD71 uses 16:inputs and 14 outputs for non-numerical com-munications with the AISCPU. I/O signal assignment and functions are given below.

Table 3.9 shows I/O signals with the A1SD71 in slot No. 0 and No. 1 of the main base unit.
Device $X$ indicates an input signal from the A1SD71 to the A1SCPU.
Device $Y$ indicates an output signal from the A1SCPU to the A1SD71.
Table 3.9 I/O Signal List

| Signal Direction: A1SD71 to A1SCPU |  | Signal Direction: A1SCPU to A1SD71 |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Device number | Signal | Device number |  | Signal |
| XO to XF | Not used | Yo to YF | Not used |  |
| X10 | Watchdog timer error (Detected by the A1SD71) | Y10 to Y1F | Used by system. Unavailable to the user. |  |
| X11 | A1SD71 ready |  |  |  |
| X12 | Positioning complete |  |  |  |
| $\times 13$ |  |  |  |  |
| X14 | BUSY |  |  |  |
| $\times 15$ |  |  |  |  |
| X16 | Zero return request |  |  |  |
| X17 |  |  |  |  |
| X18 | Positioning commenced |  |  |  |
| X19 |  |  |  |  |
| X1A | Battery error |  |  |  |
| X1B | Error detection |  |  |  |
| X1C | Zero return complete |  |  |  |
| X1D |  |  |  |  |
| X1E | M code ON |  |  |  |
| X1F |  |  |  |  |
| X20 to X2F | Unusable | Y20 | X axis | Positioning start |
|  |  | Y21 | $Y$ axis |  |
|  |  | Y22 | Interpolation |  |
|  |  | Y23 | $X$ axis | Zero return start |

|  |  | Y27 | $X$ axis Forward jog start |  |
|  |  | Y28 | $X$ axis Reverse jog start |  |
|  |  | Y29 | Y axis Forward jog start |  |
|  |  | Y2A | Y axis Reverse jog start |  |
|  |  | Y2B | $X$ axis | M code OFF |
|  |  | Y2C | $Y$ axis |  |
|  |  | Y2D | PC ready |  |
|  |  | Y2E | Used by system. Unavailable to the user. |  |
|  |  | Y2F |  |  |  |

## IMPORTANT

Y2E, Y2F, X20 to X2F, and Y10 to Y1F are reserved for use by the OS or for special applications which are detailed later.
When the above devices are used (turned ON/OFF) using a sequence program, normal functioning of the A1SD71 cannot be guaranteed.

Detailed explanation of I/O signals
This section explains ON/OFF timing of I/O signals and I/O signal conditions. The numbers in () shows the device number that corresponds to Table 3.9.
Fig 3.42 gives details about ON/OFF timing of I/O signals.
(1) Watchdog timer error signal (X10)

Switches ON when a WDT error occurs by using the A1SD71 self-diagnostic function.
(2) A1SD71 ready signal (X11)

Switches ON according to the ON/OFF state of the PC ready signal (Y2D). However, following time ( $t$ ), the A1SD71 ready signal (X11) must be turned ON after checking parameter and zero return data when the PC ready signal (Y2D) goes ON.
Use this signal for the interlock in the sequence program.

(3) Positioning complete (X12, X13)

Switches on for a period set in the parameters after each position is reached. (Ignored if the positioning complete signal output time $=0$.)
Switched off at positioning start, zero return start, inching start, jog start, and power on.
If positioning is stopped midway, the positioning complete signal does not switch on.
Positioning complete signals do not go on in the speed control mode.
(4) BUSY (X14, X15)

Switches on at positioning start, zero return start, inching start, and jog start. Switches off after pulse output and dwell time have elapsed.
(Refer to Fig. 3.42.) (Remains on during positioning.)
Switches on while the test function is being used on the peripheral device or the AD71TU.
(5) Zero return request signals ( $\mathrm{X} 16, \mathrm{X} 17$ )

Switches ON when any of the following conditions occur, and OFF when zero retum is complete.
When the power supply is turned ON to the A1SD71 module
When the drive unit READY signal (READY) goes OFF during BUSY
After the PC ready signal (Y2D) goes ON, it takes about 1.5 seconds
When a parameter and a zero return data are written from the peripheral device
When zero return starts
When the following are selected in test mode of a peripheral device:

1) Zero return
2) Positioning
3) JOG operation
4) Manual pulser
(6) Positioning commenced signals (X18, X19)

When the A1SD71 starts positioning processing by positioning (zero return and the JOG operation are contained) and the start signal turns ON, these signals go ON. Then, these signals go OFF when the start signal turns OFF.

Not turned ON in the test mode by a peripheral device or AD71TU.
(7) Battery error (X1A)

Switches on when battery voltage drops.
(8) Error detection (X1B)

Switched on by any of the errors in Chapter 8. Switched off when the error is reset. For resetting, refer to Section 6.3.2 (7).
(9) Zero return complete (X1C, X1D)

Switches on to indicate the completion of zero return. Switched off at the start of the next process.
(10) $M$ code ON signals (X1E, X1F)

These are turned ON when starting in the WITH mode.
When positioning is completed, they are turned ON in the AFTER mode. When an $M$ code OFF signal goes ON, the M code ON signal goes OFF. If the M code is not designated (when M code is set to 0 ), the M code ON signal remains OFF.
This signal remains OFF in the test mode when using a peripheral device or AD71TU.

## Remark

[^0](11) Positioning start (Y20, Y21, Y22)

Becomes valid at the leading edge of this signal.
(12) Zero return start (Y23, Y24)

Becomes valid at the leading edge of this signal.
(13) Stop (Y25, Y26)

One of these signals being ON stops zero return and positioning and JOG operations.
(If these signals are turned ON during BUSY, the M code ON signal goes OFF.)
After an operation stops, operations can be restarted by a positioning start signal. (Section 6.3.10 gives details about concrete examples.)
(14) JOG operation (Y27 to Y2A)

When these signals go ON, a JOG operation is executed. Operations are decelerated and stopped automatically by turning OFF this signal.
(15) M code OFF (Y2B, Y2C)

The leading edge of these signals makes the $M$ code $O N$ signal go OFF.
(16) PC ready signal (Y2D)

Sends the correct PC CPU operation to the A1SD71.
At the start of positioning, the zero return jog operations (other than those carried out in a peripheral device or AD71TU) signal must be ON.
However, if one axis is in BUSY in the test mode when using a peripheral device, the leading edge of the PC ready signal is ignored.
Then, when both axes are not in BUSY, execution takes place.

1) Parameter checking and initialization
2) Zero return data check
3) Zero return request $O N, A 1 S D 71$ ready signal $O N$

The following time ( t ) the signal of 3 ) after a PC ready signal goes ON must go ON to process 1) and 2).

If the PC ready signal goes OFF when A1SD71 is BUSY, positioning is stopped. Then, the M code ON signal goes OFF, and the M code is cleared. However, even if the PC ready signal goes OFF in BUSY when using a peripheral device or AD71TU in the test mode, positioning does not stop.

Note : If positioning operation is shorter than the positioning complete signal output time in the parameter, the positioning complete signal may be output continuously.

* : When a signal with a * symbol is ON before the positioning start signal goes ON, the signal with the * symbol goes OFF when the positioning start signal goes ON.

## 3. SPECIFICATIONS

|  |  | 2A | 4 A | Inching B |  |
|  |  | 9 A | 10A | Zero－phase signal （밍） |  |
|  |  | 98 | 108 |  |  |

Table 3.11 A1SD71 I/O Interfaces (Continued)

Select the A or B type by parameter setting. (For details, refer to Section 3.4.1.)

### 3.8 Battery Specifications

Table 3.12 gives the specifications of a battery used for an A1SD71.
Table 3.12 Battery Specifications

| Items | Type |
| :---: | :---: |
| Nominal voltage | 3.6 VDC |
| Guarantee period | 5 years |
| Total power failure time | 300 days $(7200$ hours $)$ |
| Application | Back-up for setting data |
| Size $(\mathrm{mm})$ | $\phi 16($ dia $) \times 30$ |

## 4. HANDLING

This section explains the handling (installation preparations) and nomenclature of the A1SD71.

### 4.1 Handling Instructions

(1) Since the body case is made of plastic, protect the A1SD71 from dropping and sudden impacts.
(2) Keep conductive debris out of the unit.
(3) Turn the PC CPU power supply OFF before installing or removing the unit to or from the base.
(4) Turn the PC CPU and drive module power supply OFF before connecting or disconnecting the drive unit connector.
After confirming the correct insertion direction, insert the connector directly from the front. Then, tighten the two fixing screws.
When the drive unit is not connected, keep the connector area cover closed.
(5) When the A1SD71 is not BUSY, connect a peripheral device or AD71TU to the A1SD71.
After confirming the correct insertion direction, insert the connector directly from the front. Then, tighten the two fixing screws.
When a peripheral device or AD71TU is not connected, keep the connector area cover closed.
(6) To install the module to a base unit, first put the module mounting hook in the module mounting hole, and then tighten the two module mounting screws to secure the module.
To remove the module, loosen and remove the two module mounting screws first, and then disengage the module mounting hook from the module mounting hole.

### 4.2 Nomenclature

## 4. HANDLING

### 4.3 Settings

Internal setting of the A1SD71 is as shown below.

### 4.3.1 Battery connection

The battery backs up the IC-RAM during power failures. The leads are disconnected before shipment to prevent battery drainage.
Always connect the battery leads before using the A1SD71.
(Refer to Section 9 for details about batteries.)

## IMPORTANT

The components on the printed circuit board may be damaged by static electricity. When handling the printed circuit board:

1) Ground all tools, the work bench, etc.
2) Do not touch conductive areas or electrical components.

## 5. LOADING AND INSTALLATION

## 5. LOADING AND INSTALLATION

This section explains the methods for loading and installation and the precautions to take to increase system reliability and to use the functions most efficiently.

### 5.1 Unit Wiring Precautions

When the A1SD71 is connected to the base (main base unit and extension base), heed the following:
(1) Do not connect it to the extension base without a power supply module (A1S5[] extension base).
(This is because the 5 VDC current consumption is very high.)
(2) If the board temperature exceeds $55^{\circ} \mathrm{C}$, consider forcible ventilation of the PC CPU board.

### 5.2 Wiring

The following describes (a) precautions when doing wiring between the A1SD71 and external devices, and (b) how to use the external wiring connector.

### 5.2.1 Wiring precautions

Precautions when doing wiring between the A1SD71 and external devices (including a drive unit) are described below. A connection examples is given in Appendix 3.
(1) Length of connection cable between the A1SD71 and drive unit

The length of the connection cable between the A1SD71 and the drive unit is generally 1 to 3 meters ( 3 to 10 feet). However, the distance depends on the drive unit specifications.
Make sure to confirm the correct specifications.
(2) I/O signal wiring

- Do not put the connection cable next to the power or main circuit cable.
- If the connection cable has to be brought close to them, either separate the ducts or use a conduit.
- If the cables must be bundled together, use a batch-sealed cable and ground them on the PC CPU side.
- If the cables are wired with conduit, make sure to ground the conduit.
- Keep A1SD71 wiring and other electric wires at least 10 cm apart.
- If the connection cable is too long, and is too close to a main circuit cable, noise may cause a malfunction.

## 5. LOADING AND INSTALLATION

Examples (bad example at top, good example at bottom)

## REMARK

When there is a lot of noise between the A1SD71 and servo amplifier, provide wiring from the pulse string output terminal from the A1SD71 using shielded twisted-pair cable that is different from other shielded cables.

(3) 24 VDC wiring notes

When a servo drive unit has a built-in power supply of 24 VDC, a wraparound circuit is made by the state of a power supply. A malfunction will occur if a separate power supply is supplied externally. Therefore, do not use the built-in power supply and external power supply together.
[Wraparound circuit]

$E 1>E 2$
Even if the pulse output of A1SD71 is OFF, the power supply flows in a servo unit pulse input line.

### 5.2.2 External wiring connector specifications

| Model Name |  |
| :--- | :--- |
| Connector | FCN-361J040-AU |
| Connector cover | FCN-360C040-B |

[^1]
### 5.2.3 Connecting external wiring

The A1SD71 has the following connectors:
When connecting an electric wire, disassemble as shown in Fig. 5.1.
The disassembly and assembly procedures are as follows:

1) Loosen the four screws, and remove them.
2) Open the cover from the connector side.
3) Connect the electric wire (refer to Section 5.2.3(1) to (3)).
4) Put connectors into the cover.
5) Pull open the fixed screws.
6) Put the covers together.
7) Fasten the four screws. Use longer screws for cable clamping.

Always keep track of small screws and nuts when disassembling.

Fig. 5.1 Connector

### 5.2.4 Connecting electric wiring

Connector pin wiring is shown in Fig. 5.2. Connect in accordance with the 1/O numbers (refer to Section 3.7.2).
(1) Use $0.3 \mathrm{~mm}^{2}$ or less wires. Thicker wires cannot pass through the cable clamps.
(2) Solder the wires to the pins. Remove electric wire insulation carefully. Be careful not to cause a short circuit.
Wires should be threaded through an insulating tube.
(3) Secure the electric wire in the cable clamp of a cover.

When there are several connecting electric wires, wrap them together with tape.

Fig. 5.2 Connection

## 6. PROGRAMMING

### 6.1 Program Creation

### 6.1.1 Program composition

A1SD71 programs are usually incorporated in an overall program. Programs are classified as follows, and a program example is shown.

## REMARK

Unless otherwise specified, I/O numbers used in thes manual assume that the A1SD71 is located at slot 0 and 1 of the main base.

The number of devices (M, D, T, etc.) used in the program example can be changed freely.

## POINTS

(1) There are 48 A1SD71 input/output points and the module occupies two slots. Therefore, execute I/O allocations using the GPP function as follows:
First half slot............. Empty slot :16 points Second half slot.........Special-function module :32 points
(2) When executing an A1SD71 FROM/TO instruction, the head I/O number of the second half slot of A1SD71 is used.

Therefore, the number to be set by the FROM/TO instruction becomes the head I/O number allocated to the A1SD71 +010 H .
(3) If the first half A1SD71 slot is set to empty slot 0 in the I/O allocation by the GPP function, 16 first half slot points are saved.
The I/O number to be set in the FROM/TO instruction becomes the same number as the first I/O number allocated to the A1SD71.

### 6.1.2 Precautions when creating programs

(1) Sequence program conditions

Use the A1SD71 to provide the program shown in Fig. 6.2 to the system.

- If the CPU is reset when A1SD71 is BUSY, the A1SD71 may detect an error. Therefore, reset the error by using this ladder.

Fig. 6.2 Necessary Program
(2) PC ready reset

When an error is detected in the sequence program, create a program so that the PC ready signal (Y2D) is reset by detecting the error.
(3) Zero return

Be sure to execute zero return when turning the power ON.
(The current values of the positioning module cannot be guaranteed when turning the power ON.)
(4) Limit switch for near-point dog

Use a limit switch with high contact reliability. If the near-point dog signal is not input during zero return, the movement continues at the zero return speed.
(5) Overrun processing

Overrun is prevented in the upper/lower strokes by limit setting. However, this applies when the A1SD71 is operating normally. For safety, Mitsubishi recommends setting a marginal limit switch and external circuit that turns OFF power to the motor power when the limit switch goes ON.
(6) Emergency stop

The STOP input signal is a positioning deceleration stop signal which cannot be used for an emergency stop. Stop the drive unit by external contact in the case of an emergency stop.
(7) Upper/lower stroke limit values

Confirm whether correct upper/lower stroke limit values have been set.
(8) Speed limit value

Confirm whether a proper speed limit has been set to a parameter.
(9) Do not set the high speed at the JOG speed. Execute operations at the low JOG speed.
(10) Speed during interpolation operations

The speed during interpolation operations is decided with the $X$ and $Y$ axes. Therefore, set the speed of both axes correctly so that either axis operates at the setting speed or lower.
(11) Refer to section 5.1 for details about unit wiring precautions.

### 6.2 Operations Using a Peripheral Device or AD71TU

A1SD71 positioning operations can be executed in the test mode using a peripheral device or AD71TU. Operating conditions are as follows:
(1) Install a peripheral device or AD71TU in the A1SD71.
(2) Operations are enabled independently of the ON/OFF state of the PC ready signal (Y2D) and A1SD71 ready signal (X11).
(3) Data cannot be read and written from/to the peripheral device or AD71TU during BUSY when operating a peripheral device or AD71TU in the test mode.
(4) ON/OFF of the $M$ code will be ignored. (Buffer memory $M$ code area ( $X$ axis: $46, Y$ axis: 346 ) is cleared.)

### 6.3 ACPU Programming

### 6.3.1 Data read and write precautions

(1) Data read from and written to the sequence program should be kept to a minimum for optimum program scan time. The majority of the A1SD71 data must theretore be written to the buffer memory by the peripheral device or the AD71TU.
(2) The parameters and zero return data is checked at power on and when the PC ready signal (Y2D) changes from OFF to ON.
(3) Positioning data is checked immediately before it is processed. Any error will cause the error signal (X1B) to switch on and, in most cases, positioning to stop.

Fig. 6.3 Positioning Data Check
An error is flagged if the total distance requested exceeds the upper (or lower) stroke limit when incremental position addressing is used.

### 6.3.2 Data communication with PC program

(1) Read and write instructions
(a) Read from A1SD71

FROM instruction: Also FROMP, DFRO, and DFROP.
[Format]

Fig. 6.4 Read Instruction FROM

Example: To read one word from buffer memory address 600 ( X axis output speed) to D2 with the A1SD71 assigned to X130 to X13F and Y140 to Y14F.

Fig. 6.5 Read Example
(b) Write to A1SD71

TO instruction: Also TOP, DTO, and DTOP.
[Format]

Fig. 6.6 Write Instruction TO

Example: To write positioning information to buffer memory address 3872, with the A1SD71 assigned to X20 to X2F and Y30 to 3F.

Fig. 6.7 Write Example

## POINT

A maximum of 2,000 words may be read or written using one instruction. Note however that in this case the watch dog timer (WDT) may need to be reset.
(2) Present value read program example

| [Example] | Indication of X axis present value |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| [Notes] | (1) During positioning, the present value as stored in the A1SD71 buffer memory lags behind the actual value by about 0.1 seconds. <br> (2) The present value is two words long. |  |  |  |  |  |
| [Data tran | CPU data reg <br> Written to D11 and | - |  |  | Address <br> 602 <br> 603 | SD71 buffer memory <br> X axis present value - |
| [Program] |  | $\mathrm{H} 1$ | K602 <br> DBCD | $\begin{aligned} & \text { D11 } \\ & \hline \text { D11 } \end{aligned}$ | K1 <br> K8Y20 | Converts the contents of D11 to D12 into BCD for display on a seven segment device |

(3) Speed read program example while BUSY

| [Example] | Y axis speed read |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| [Note] | None |  |  |  |  |
| [Data transfer] | CPU data register |  |  | Address <br> 600 <br> 601 | 1SD71 buffer memory <br> $X$-axis output speed <br> $Y$-axis output speed <br>  <br>  |
| [Program] | Speed read | H1 | K601 |  |  |

## 6. PROGRAMMING

(4) Data number and pointer write program example

(5) Parameter and zero return data write program example

## 6. PROGRAMMING

(6) Speed change program example while BUSY

(7) Error reset program example

## 6. PROGRAMMING

### 6.3.3 Positioning start program

There are two start programs (a) and (b) below.
(a) When setting data is written by using a peripheral device or AD71TU The progran is simple because it is not necessary to communicate setting data between a CPU and A1SD71.
This method is recommended when the positioning data is within 400 points and there are tew setting data changes.
(b) When setting data is externally set

When there are a great many positioning data changes, communications between the CPU and A1SD71 and a program for the writing/reading to/from the buffer memory are necessary.
Many data registers and programs must be utilized and the operations takes a long time. Therefore, simplify operations without using unnecessary programs.
(1) Flow chart

Write start No. to buffer memory.

(2) Conditions Signal State Remarks

Table 6.1 Start Conditions

|  | Signal | State | Remarks |
| :---: | :---: | :---: | :---: |
| External signal | Drive unit READY | ON |  |
|  | Stop signal STOP | OFF |  |
| Interface signal | A1SD71 ready (X11) | ON | * |
|  | Relevant axis busy (X14, X15) | OFF |  |
|  | Relevant axis positioning commenced (X18, X19) | OFF | - |
|  | Relevant axis $M$ code ON (X1E, X1F) | OFF | - |
|  | Relevant axis stop (Y25,Y26) | OFF |  |
|  | PC ready (Y2D) | ON | * |
| Other | Positioning data | Within setting range | If positioning speed is higher than the speed limit value, positioning is executed at the speed limit value. |
|  | Start data number |  |  |
|  | Start axis |  |  |
|  | Pointer |  |  |
|  | Zero address |  |  |
|  | Monitor present value | $0 \leq$ present value $\leq 16,252,928$ |  |
|  | Atter BREAK signal from the peripheral device or STOP signal from the AD71TU, neither axis should be busy. |  |  |

- In peripheral device or AD71TU test mode, X11, X18, X19, X1E, X1F, and Y2D should not be checked.
(3) Timing

## (4) Program

(a) Operating data already written from the peripheral device.

The following program assumes that parameters, zero return data, and positioning data have already been written to the A1SD71 buffer memory using the peripheral device.

(b) Setting data specified using sequence program

Assumes data is stored in registers as shown in Table 6.2.

Note : For time schedule, refer to Fig. 3.42

### 6.3.4 Jog operation program

(1) Flow chart

Turn on jog start signal (Y27, Y28, Y29,Y2A).

(2) Conditions

Table 6.3 Jog Operation Start Conditions

|  | Signal | State | Remarks |
| :---: | :---: | :---: | :---: |
| External signal | Drive unit READY | ON |  |
|  | Stop signal STOP | OFF |  |
| Interface signal | A1SD71 ready (X11) | ON | * |
|  | Relevant axis busy (X14, X15) | OFF |  |
|  | Relevant axis positioning commenced (X18, X19) | OFF | * |
|  | Relevant axis M code ON (X1E, X1F) | OFF | * |
|  | Relevant axis stop (Y25, Y26) | OFF |  |
|  | PC ready (Y2D) | ON | * |
| Others | Jog speed | Starting bias speed or higher | If jog speed specified is higher than the jog speed limit value, operation is performed at the jog speed limit value. |
|  | Neither axis should be BUSY after a BREAK signal has been received from the peripheral device and both axes have stopped. |  |  |
|  | Neither axis should be BUSY after a STOP signal has been received from the AD71TU and both axes have stopped. |  |  |

*In peripheral device or AD71TU test mode, X11 and Y2D should not be checked.
(3) Timing

## POINTS

(1) During jog operation the upper and lower stroke limits are ignored.
(2) When backlash compensation has been specified, the minimum movement allowed will be the backlash specified.

## (4) Program

The drive is enabled for as long as the jog switch is pressed.

## REMARKS

1. The A1SD71 will wait until the output speed is zero before giving a second jog output.

Fig. 6.8 Jog Repetition
2. Interpolation is not enabled during jog operation.
3. The A1SD71 defaults to forward jog if both forward and reverse jog commands are given simultaneously.

## POINT

* 1 When the speed is changed to 2000 in a program, it is internally processed as $2000 \times 10^{\prime}$. Therefore, the actual speed becomes $20,000 \mathrm{~mm} / \mathrm{min}$.

### 6.3.5 Manual pulse generator operation program

Manual pulse generator operation executes positioning according to the following principle.
(1) Pulse is output to an A1SD71 by operating manual pulse generator.
(2) Input pulse is converted to output pulse inside an A1SD71.

A1SD71 takes several tens of mm seconds for the internal processing such as output pulse conversion.
Conversion formula:
Number of output pulse of A1SD71 $=\frac{R \times Q}{P}$ (formula, 1)
P: Travel distance per pulse set at parameter
Q: Travel distance per pulse of manual pulse generator set at parameter
R: Number of input pulses of manual pulse generator
(3) Number of output pulses calculated by formula 1 above is output to a drive unit from an A1SD71.
The method of outputting pulse of A1SD71 is as follows.
(a) A1SD71's output pulse per pulse input from a manual pulse generator to an A1SD71 is output to a drive module from the A1SD71 by each input pulse from a manual pulse generator.

(b) The time obtained by the following formula is until pulse output per manual pulse generator's pulse is completed.

Pulse output speed is determined by the manual pulse generator output speed st at buffer memory (address 202 or 502).
When the manual pulse generator output speed is too fast, drive unit cannot follow.
In this case, set slower manual pulse generator output speed.
Pulse output time of A1SD71 =
(A1SD71 internal processing time) + (pulse output time) [msec]
(1)
(2)
(formula, 2)

1) A1SD71 internal processing time: 20 to 99 msec
2) Pulse output time:
(Travel distance per pulse of manual pulse generator) (Number of pulses counted by A1SD71)
(A1SD71 pulse output speed)*

After outputting pulse from A1SD71 is completed, output pulses which correspond to the number of pulses input from a manual pulse generator is output from an ATSD71 taking the time shown in formula 2.

|  |  |
| :---: | :---: |
|  |  |

Therefore, smooth operation is impossible even if pulse is input from a manual pulse generaotr sequentially. Pulse is output intermittently. When the manual pulse generator input time ( $\mathrm{msec} \mathrm{)} \mathrm{is} \mathrm{less} \mathrm{than} \mathrm{the}$ value calculated by formula 2, output pulse is accumulated in A1SD71.
Output pulse accumulated in A1SD71 is output sequentially after A1SD71 internal processing time ( 20 to 99 msec ).
(4) During outputting pulse to drive unit, BUSY signal of corresponding axis is ON .

## POINTS

(1) When manual pulse generator operation is completed, set manual pulse generator enable to 0 .
If touching a general putse generator in the condition that manual pulse generator enable is set to " 1 ".
(2) Input pulse of manual pulse generator is counted only when the following two conditions are established.

- Manual pulse generator enable area of buffer memory is set to "1".
- Corresponding axis is not during BUSY, or during BUSY in manual pulse generator mode.
(3) When the manual pulse generator enable area is set to "0", pulse input and pulse input counters are cleared after about 0.2 seconds.

When stop signal (Y25, 26) is turned ON, pulse input and pulse output counters are cleared after about 0.2 seconds.
(4) When moved to the direction which has backlash, operation is not started if the number of output pulses is less than the backlash set value.
(5) If operation cannot be started due to an error at the time of starting manual pulse generator, pulse input counter is not cleared.
When pulse is continued to be input to A1SD71 from manual pulse generator atter a error occurs, pulse input counter causes size error, and the number of input pulses cannot be stored normally.
Therefore, stop the operation of manual pulse generator after an error occurs, and clear tahe pulse input counter by writing 0 to manual pulse generator enable area.
(6) Max. 16777215 pulses can be accumulated in the output counter.
When the number of output pulses exceeds 16777215 , output counter causes size error and the exceeded number of pulses is ignored.
Output counter can be recovered from size error by restricting generator output speed.

## IMPORTANT

When the manual pulse generator is operated in the manual pulse generator enable state during BUSY in positioning, zero return, or JOG operation mode, an error (code 73) occurs. Therefore, set the manual pulse generator enable area to 0 (disable) other than in manual pulse generator mode.
(iv) Program

## 6. PROGRAMMING

### 6.3.6 Positioning address teaching program

Positioning addresses can be written using devices.
(1) Using the jog operation

Addresses set by using the jog operation are written to the target data number of the A1SD71 buffer memory.
(2) Using the inching operation

Move the system to the required position using the manual pulse generator and write that address into the A1SD71 buffer memory.
(3) Jog then inching combined

Coarse position using the jog operation then fine position with the manual pulse generator. Write the address to the A1SD71 buffer memory.
[1] Jog to position and teach
(1) Flow chart

Turn off jog start signal.

(2) Conditions

Table 6.5 Address Write Conditions Using Jog Operation

|  | Stgnal | State | Remanks |
| :---: | :---: | :---: | :---: |
| External signal | Drive unit READY | ON |  |
|  | Stop signal STOP | OFF |  |
| Interface signal | A1SD71 ready (X11) | ON | * |
|  | Relevant axis busy ( $\mathrm{X14}, \mathrm{X15} \mathrm{)}$ | OFF |  |
|  | Relevant axis positioning commenced (X18, X19) | OFF |  |
|  | Relevant axis M code ON (X1E, X1F) | OFF |  |
|  | Relevant axis stop (Y25,Y26) | OFF |  |
|  | PC ready (Y2D) | ON | * |
| Others | Jog speed | Starting bias speed or higher | If jog speed specified is higher than the jog speed limit value, operation is performed at the jog speed limit value. |
|  | Neither axis should be BUSY after a BREAK signal has been received from the peripheral device and both axes have stopped. |  |  |
|  | Neither axis should be BUSY after a STOP signal has been received from the AD71TU and both axes have stopped. |  |  |

*In peripheral device or AD71TU test mode, X11 and Y2D should not be checked.
(3) Timing

(4) Program

System is positioned in jog mode and resulting address written to buffer memory.

## 6. PROGRAMMING

[2] Pulser inching to positioin address writing
(1) Flow chart

(2) Conditions

Table 6.6 Address Write Conditioin Using Inching Operation

| $\bigcirc$ | Signal | State | Remiarks |
| :---: | :---: | :---: | :---: |
| External signal | Drive unit READY | ON |  |
|  | STOP | OFF |  |
| Interface signal | A1SD71 ready (X11) | ON | - |
|  | Relevant axis BUSY (X14, X15) | OFF |  |
|  | Relevant axis positioning commenced (X18, X19) | OFF |  |
|  | Relevant axis $M$ code ON (X1E, X1F) | OFF |  |
|  | Relevant axis stop (Y25, Y26) | OFF |  |
|  | PC ready (Y2D) | ON | * |
| Others | "Inching enable" in buffer memory ( X axis 47 axis 347) | Bit=1 | Inching linut is ignored in the case of the zero bit. This is not an error. |
|  | Parameters | Within |  |
|  | Inching output speed in buffer memory $(202,502)$ | setting range |  |
|  | Neither axis should be busy if a [BREAK] (GPP, PHP) or [STOP] (AD71TU) signal has been received and positioning has stopped. |  |  |

": In peripheral device test mode, the signals may be off.
(3) Timing

## IMPORTANT

When the manual pulse generator is operated in the manual pulse generator enable state during BUSY in positioning, zero return, or JOG operation mode, an error (code 73) occurs. Therefore, set the manual pulse generator enable area to 0 (disable) other than in manual pulse generator mode.
(4) Program

System is inched to required position and resulting adress written to buffer memory.

## [Program]

## 6. PROGRAMMING

[3] Writing positioning address according to the data number from the digital swich.
program example
Program example which is written as a address in the condition at fixed buffer memory after executes positioning according manual pulse generator operation or JOG generator operation is as follows.
Data number assume to be at BCD-3-digit of X50 to X5B.

### 6.3.7 Zero return

## (1) Flow chart <br> (2) Conditions

Table 6.7 Zero Return Conditions

|  | Signal | State | Remarks |
| :---: | :---: | :---: | :---: |
| External signal | Drive unit READY | ON |  |
|  | Stop signal STOP | OFF |  |
| Interiace signal | A1SD71 ready (X11) | ON | * |
|  | Relevant axis busy (X14, X15) | OFF |  |
|  | Relevant axis positioning commenced (X18,X19) | OFF |  |
|  | Relevant axis zero ruturn complete (X1C,X1D) | OFF |  |
|  | Relevant axis M code ON (X1E, X1F) | OFF |  |
|  | Relevant axis stop (Y25, Y26) | ON |  |
|  | PC ready (Y2D) | ON | * |
| Others | Zero return data | No error |  |
|  | Repetition of zero ruturn start | Max. twice consecutively. |  |
|  | Neither axis should be BUSY after BREAK (peripheral device) or STOP (AD71TU) has been received and positioning has stopped. |  |  |

*In peripheral device or AD71TU test mode, Y2D should not be checked.
(3) Timing

(4) Program

### 6.3.8 Present value change

(2) Conditions
Table 6.8 Present Value Change Condition

| Signal | State |
| :---: | :---: |
| Relevant axis BUSY | OFF |

(3) Program

## REMARKS

1. Data should be written to two words of the upper and lower digits in the current value change area. Writing to only one word causes an error, and the current value is not changed.
2. The current value is modified to a zero address by zero return after changing the current value. However, parameter and zero return data must be written before zero return.

## 6. PROGRAMMING

MELSEC-A

### 6.3.9 Positioning stop

The positioning process may be stopped while the A1SD71 is busy as follows:
Table 6.9 Stop Signals

| Item | Valid <br> Signal |  | Independent <br> operation |  |
| :--- | :---: | :---: | :---: | :---: |
| Inter- <br> polation <br> Operation |  |  |  |  |
| STOP signal from drive unit ON |  | Relevant <br> axis | Other <br> axis | 0 |
| PC ready signal (Y2D) OFF* |  | 0 |  | 0 |
| Stop signal from PC (Y25, Y26) ON |  | 0 | 0 | 0 |
| BREAK key input from peripheral <br> device or STOP key input from AD71TU |  |  | 0 |  |

O indicates that the signal is valid.

* : In peripheral device or AD71TU test mode, positioning is not stopped if Y1D is ON or OFF.
(1) Note on use of stop signal
(a) Deceleration is valid after stop signal is received

On receiving any of the stop commands given in Table 6.9; the system is decelerated to a stop. All emergency stops and limits must be hard-wired.

Fig. 6.9 Stop Signal
(b) Stop signal during deceleration

The operation decelerates and stops at that speed except in the following cases.
When zero return is executed, only the stop signal during deceleration is stopped.

Fig. 6.10 Stop Command Received During Zero Return Deceleration

## REMARK

In the case of a stop when the stop signal is turned ON after the near-point dog for zero return, return to the position prior to the zero-point dog by jog operation, and retry. Otherwise, the A1SD71 can malfunction.
(c) Stop signal reset

A start signal ( $\mathrm{Y} 10, \mathrm{Y} 11, \mathrm{Y} 12$ ) is only valid at its leading edge, therefore, if it is already on when the stop signal is reset the process will not restart.
(d) M code

The conditions shown in Table 6.10 turn off the M code ON signal at the relevant axis. When the PC ready signal is turned off, the $M$ code is set to " 0 ".
(e) Stop during interpolation operations

During interpolation operations, both axes can be stopped by either the X - or the Y -axis stop signal. However, when interpolation and independent operations are combined in the start data number automatic switching (pointer setting), the axis stops as shown below at the point update. Therefore, after going to independent positioning, the stop signal is only valid for the self axis.

Fig. 6.11 Stop During Interpolation
(2) Other stop signals

In addition to the four stop signals in Table 6.9, the following in Table 6.10 also stops processing while the A1SD71 is BUSY. For all the following, positioning is decelerated to a stop and the peripheral device displays an error message.

Table 6.10 Stop Signals

| Item | Valid <br> Signal | Independent <br> operation |  | Inter- <br> polation <br> Operation |
| :--- | :---: | :---: | :---: | :---: |
| Relevant <br> axis |  | 0 |  |  |
| Ready signal from drive unit OFF | - | 0 |  | 0 |
| Operation error (8231 error) |  | 0 | 0 | 0 |
| A1SD71 bus error |  | 0 | 0 | 0 |

(3) Restarting after a stop
(a) Proceed to the next address

The table below shows when data number automatic switching is used and not used.

|  | Absolute method | Incremental method <br> Two axes independent <br> operation/ <br> two axes interpolation <br> operation |
| :--- | :---: | :---: | | Two axes independent <br> operation/ <br> two axes interpolation <br> operation |
| :---: |
| Data number automatic <br> switching is used. |
| Data number automatic <br> switching is not used. |

## REMARK

Apply the following processes for the unavailable mode:

- Restart after zero return.
- Restart after resetting the positioning data.
- When setting the data number to the 1 st point ( $X$-axis address: $0, Y$-axis address: 300) in the A1SD71 positioning start data area, data number automatic switching is not used.
- When setting several data numbers to the A1SD71 positioning start data area (X-axis addresses: 0 to 39, $Y$-axis addresses: 300 to 339 ), data number automatic switching is used.

1) When data number automatic switching is not used in the absolute method.
The executing data number is stored to buffer memory addresses 48 ( X axis) and 348 ( Y axis) during positioning and kept until the next start. This applies to the restart after stop.

(b) Zero return method

Refer to Section 6.3.7.
(c) Restarting after a stop during zero return

When zero return starts cannot be repeated. Execute zero return after the following operations:

1) Execute positioning from the correct data number.
2) Execute positioning using a jog operation when positioning is stopped near the zero point.
(d) Positioning is stopped by using the BREAK key on the peripheral device.
BREAK key is valid for the $X$ and $Y$ axes. Positioning can be restarted when both axes are not BUSY. If one axis is BUSY, starting is disabled.

## 7. CHECK LISTS

The check lists given in associated equipment manuals should also be referred to. For the A1SCPU, refer to the A1SCPU User's Manual.

### 7.1 General Check List

Before testing the A1SD71, check the following:
Table 7.1 General Check List

|  | Check Point | Description | Check |
| :---: | :--- | :--- | :--- |
| 1 | Battery | - Check that battery leads are connected to the <br> printed circuit board. |  |
| 2 | Parameter setting | - Check that parameters have been set. <br> - Check that values are correct. |  |
| 3 | Zero return data setting | - Check that zero return data has been set. <br> - Check that values are correct. |  |
| 4 | Positioning data | - Check that positioning data has been set. <br> - Check that values are correct. |  |

## POINT

If only one axis ( X or Y axis) is used, parameters and zero return data must be written to the unused axis. Otherwise zero return will result in error and switch on the X1B (error detection) signal.
(Data written must be within the range given in the User's Manual. Parameters may be default values.)

### 7.2 Tests and Adjustments Procedure

### 7.2.1 Sequence check

Use the following procedure to check the system.
Set the key switch on the A1SD71 front panel to "LOCK." This only changes the present value and allows checking of the positioning functions with the feed pulse output stopped.

### 7.2.2 Positioning operation check

After completing the check given in Section 7.2.1, turn the key switch on the front of the A1SD71 to OFF or M.PRO.
Check the operation after setting the parameter speed limit value at slow speed and preparing for an emergency stop if a dangerous state occurs.
The positioning aperation should be checked after executing zero return.
The peripheral device (SWOGP-AD71P) has a handy monitor function and is valid when the operation is faulty. Take corrective action after reading the error code and finding the cause of the error.

## 8. TROUBLESHOOTING

Errors may be detected by:

1) The A1SD71 CPU; or
2) The peripheral device during program development and debugging.

This section describes errors detected by the A1SD71 CPU, for other errors see the SW0GP-AD71P Operating Manual.

### 8.1 Errors Detected by A1SD71

The A1SD71 has various error check functions. When an error occurs, an error code is written to address 45 ( X axis) and 345 ( Y axis) in the buffer memory.
(1) A new error will overwrite the previous one in the buffer memory. The code is displayed on the lower left hand side of the peripheral device's screen.
(2) Error code " 0 " indicates no error.
(3) Error reset

Errors are reset by writing a "1" to buffer address 201. (See Section 6.3.2 (7))

For resetting of errors using the peripheral device, refer to the SWOGPAD71P Operating Manual.
(4) Error detection

X 1 B is the error detection flag. Resetting the error also resets X1B.

Error codes are classified as shown in Table 8.1.

Table 8.1 Error Code Classification

| Error Code | Error Classification | Remarks |
| :--- | :--- | :--- |
| 1 to 49 | Data range error | Refer to Section 8.1.1. |
| 50 to 59 | A1SD71 HOLD error | Refer to Section 8.1.2. |
| 60 to 69 | Buffer memory write disable error | Refer to Section 8.1.3. |
| 70 to 79 | A1SD71 start and operation error | Refer to Section 8.1.4. |
| 90 to 99 | Other error | Refer to Section 8.1.5. |

### 8.1.1 Data range errors

Any of the operations shown in Table 8.2 will prompt a data range check by the A1SD71 as shown below.

Table 8.2 Data Range Check

| Data | Operation |
| :---: | :--- |
| Parameters | - At power on* <br> - When parameters have been transferred from the peripheral device to the <br> A1SD71. <br> - When PC ready signal (Y2D) changes from OFF to ON. <br> - When positioning, zero return, jog, or inching has been selected in periph- <br> eral device test mode. |
| - When parameters or zero return data has been transferred from the periph- <br> data | eral device to the A1SD71. <br> - When PC ready signal (Y2D) changes from OFF to ON. <br> - When positioning, zero return, jog, or inching has been selected in periph- <br> eral device test mode. |
| Positioning <br> data | - At the start of positioning <br> (Refer to the figure in Section 6.3.) |

- : The power on check will not give an error code or an error detection signal (X1B).

A list of error codes is shown in Table 8.3.

Table 8.3 Data Range Error Codes

| Error code | Data Type | Check Point | Check Range <br> (Errors occur outside the following ranges.) | Romarks |
| :---: | :---: | :---: | :---: | :---: |
| 0 |  |  | Normal |  |
| 1 | Parameter | Travel per pulse | 1 10 100 |  |
| 2 |  | Speed limit value | 1 to 12,000 in mm, inch, or degree (If travel per pulse is " $a$ " (unitPLS), speed V range is restricted as $\binom{\frac{V \text { (unit/PLS }}{[\mathrm{a} \text { (unit/PLS }] \times 60} \leq 200,000}{\text { PLS } / \mathrm{sec}}$ <br> 1 to 20,000 in PLS |  |
| 3 |  | Jog speed limit value | 1 to parameter speed limit value |  |
| 4 |  | Starting bias speed | 0 to parameter speed limit value |  |
| 5 |  | Acceleration and deceleration times | 64 to 50,000 |  |
| 6 |  | Backlash | 0 to 255 in PLS <br> 0 to 65535 in mm , inch or degree | *3 |
| 7 |  | Upper stroke limit | 0 to 162,000 in mm 0 to 16,200 in inch or degree 0 to $16,252,928$ in PLS | *2 |
| 8 |  | Lower stroke limit | 0 to upper stroke limit |  |
| 9 |  | Error compensation | 0 to 100,000 in mm, inch, or degree |  |
| 10 |  | Travel per manual pulse during inching | 1 to 100,000 in mm, inch, or degree 1 to 100 in PLS |  |
| 11 |  | Positioning method | 00, 01, or 10 in bits b4 and b3 |  |
| 12 |  | Positioning complete signal duration | 0 to 20,000 |  |
| 20 | Zero return data | Zero address | 0 to 1,620,000,000 in mm , inch, or degree 0 to 16,252,928 in PLS | *2 |
| 21 |  | Zero return speed | Starting bias speed to parameter speed limit. (Not 0) | *1 |
| 22 |  | Creep speed | Starting bias speed to parameter zero point return. (Not 0) |  |
| 23 |  | Dwell time | 0 to 499 |  |
| 24 |  | Torque limit | 10 to 250 |  |
| 30 | Positioning data | Positioning speed | Starting bias speed to parameter speed limit. (Not 0) | *1 |
| 31 |  | Positioning address | Within stroke limits |  |
| 32 |  | Dwell time | 0 to 499 |  |
| 33 |  | Positioning pattern | 00,01 , or 11 in bits 0 and 1 <br> ( 00 only if start data No. is 400 ) |  |
| 34 |  |  | Pattern 11 may be used a max. of 9 times consecutively. |  |
| 35 |  |  | Travel for consecutive 11 patterns must be in the same direction. |  |
| 36 |  |  | The addressing method must be the same for consecutive 11 patterns. |  |
| 37 |  |  | Interpolation start setting for both axes must be the same (00 or 01). |  |

Table 8.3 Data Range Error Codes (continue)

| Error Code | Data Type | Check Point | Check Range <br> (Errors occur outside the following ranges.) | Remarks |
| :---: | :---: | :---: | :---: | :---: |
| 40 | Positioning start data | Start number | 1 to 400 |  |
| 41 |  | Pointer | 0 to 19 |  |
| 42 |  | Speed change | Starting bias speed to parameter speed limit (Not 0) | *1 |
| 43 |  | Present value change | 0 to 1,620,000,000 in mm, inch, or degree 0 to 16,252,928 in PLS | *2 |
| 44 |  | Jog speed | Starting bias speed to parameter jog speed limit (Not 0) | * 1 |
| 45 |  | Start axis | When two axes are to be started at the same time, both must be set for interpolation start (00) or for dual axis start (11). |  |
| 46 |  | Start axis | The second axis must not be busy or must be behind the start point when an interpolation start (00) or a dual axis start (11) is called. |  |
| 140 |  | Inching operation speed | 1 to 20,000 |  |

*1: If the set speed exceeds the parameter speed limit value, positioning is controlled at the parameter speed limit value.
*2: If the units are mm, inch, or degree and travel per pulse is "a" (unit/PLS), the address $S$ range is restricted as given below:

$$
\frac{S \text { (unit) }}{a \text { (unit/PLS) }} \leq 16,252,928 \text { (PLS) }
$$

*3: When the travel distance per pulse is set to 1.

### 8.1.2 A1SD71 "HOLD" errors

The errors shown in Table 8.4 are indicated by the A1SD71 "HOLD" LED. Errors 50 or 51 indicate a hardware failure.
An A1SD71 bus error may be due to an A1SD71 failure or to the sequence program accessing too much of the buffer memory too frequently. In the later case, the sequence program must be changed in accordance with Section 8.2.

Table 8.4 A1SD71 Hold Error Codes

| Error <br> Code | Check Point | Error Definition |
| :---: | :---: | :--- |
| 50 | Operation element (8231) | Operation time-out error (hardware fault) |
| 51 |  | Operation error (overflow, underflow, etc...) |
|  | A1SD71 bus error | The PC has priority for accessing the buffer <br> memory. If accessing is too frequent the <br> A1SD71 may not be able to access the data. |

In the event of any of the above errors occurring 1) turn off the A1SD71 ready (X11) and 2) force BUSY processing to stop. The start signal is then not accepted.

### 8.1.3 Buffer memory write errors

Writing data from the sequence program to prohibited buffer addresses or writing when the buffer cannot accept the data prompts the error codes shown in Table 8.5. The sequence program must be checked and corrected.

Table 8.5 Buffer Memory Write Error Codes

| Error <br> Code | Shared Memory Address | Error Definition |
| :---: | :--- | :--- |
| 60 | 39,339 | Pointer value is not O though 20th point has <br> been reached. Data has been written to <br> pointer address while BUSY. |
| 61 | 40,340 | "Speed change" during interpolation. |
| 62 | $41,42,341,342$ | "Present value change" while BUSY. |
| 63 | 7872 to 7928 | Data written from PC while Y2D is on. |
| 64 | Monitoring present value area <br> Speed area | Data written from PC to a write prohibit <br> address. |

### 8.1.4 A1SD71 start and operation errors

The following errors are detected when A1SD71 cannot start operations after receiving a PC CPU command due to A1SD71 internal condition errors or A1SD71 operating errors. Error codes are shown in Table 8.6 below.

Table 8.6 A1SD71 Start and Operation Error Codes

| Error Code | Cause | Corrective Action(s) |
| :---: | :---: | :---: |
| 70 | READY signal is OFF at the start | Set the drive unit READY. |
| 71 | External stop signals (6A and 8A) are ON at the start. | Turn OFF the stop signals (6A and 8A). |
| 72 | The A1SD71 ready signal (X11) and PC CPU ready signal (Y2D) are OFF at the start. | Turn ON the PC CPU power and set the PC CPU to RUN. <br> Check the hardware. |
| 73 | The relevant axis is BUSY at the start. | Do not start when BUSY. |
| 74 | The relevant axis positioning complete signal is ON at the start. | Restart after turning OFF the start signal. |
| 75 | The $M$ code $O N$ signal is ON at the start. | Turn OFF the " M code ON " signal using the " M code OFF" signal. |
| 76 | - The stop signals (Y25, Y26) are ON at the start. <br> - Inputting the BREAK key from a peripheral device stops operations. | - Turn OFF the stop signals (Y25, Y26). <br> - Release the stop processing from the peripheral device or AD71TU. |
| 77 | Zero return is repeated more than twice consecutively. | Zero return cannot be repeated. |
| 78 | The zero return complete signal is ON when zero return is started. | Zero return has been already completed. Transfer positioning or the jog operation. |
| 79 | Outside the range from 0 to 16252928 pulses. | * Return inside the stroke limit range using jog. <br> - Change the current value. |

Note 1: Start includes;

- Zero return start
* Jog operation
- Inching operation

2: For interpolation starts, error codes are always given for both axes even if one axis has an error.

## 8. TROUBLESHOOTING

### 8.1.5 A1SD71 positioning start errors during BUSY

The following errors are detected when the drive unit ready signal is turned OFF while A1SD71 is BUSY or when positioning is stopped during zero return.

Table 8.7 BUSY Error Codes

| Error <br> Code | Cause | Corrective Action(s) |
| :---: | :--- | :--- |
| 80 | The READY signal is OFF during <br> BUSY. | Check the drive unit and turn ON the ready <br> signal. |
| 81 | Zero return is stopped. | Zero return is not allowed more than twice <br> consecutively. If necessary, return to the <br> position before near-point dog using a jog <br> operation or positioning by specifying the data <br> number, and restart zero return. |

### 8.2 Troubleshooting

### 8.2.1 General troubleshooting

### 8.2.2 Drive inoperative

## 8. TROUBLESHOOTING

### 8.2.3 Incorrect positioning

### 8.2.4 Positioning speed wrong

## 8. TROUBLESHOOTING

MELSEC-A

### 8.2.5 Corrupted positioning data

### 8.2.6 Unrequested stop

Eliminate source of noise or screen A1SD71 cables, etc...)

YES

Take appropriate measures to prevent noise interference.

- Run signal cables away from power cables.
- Use shielded twisted-pair cable for the signal cable.
- Ground the module correctly. Install the module away from noise sources.

## 8. TROUBLESHOOTING

### 8.2.7 Zero return tauk

(1) Partial zero return

(2) Zero point position has shifted (using zero-phase signal)

Note : When using the stopper method, make sure that the stop signal is input or timer setting is correct. If so, theA1SD71 or motor drive unit is faulty. Replace the faulty A1SD71 or motor drive unit.

## 9. MAINTENANCE

This section describes how to maintain the A1SD71 (unit storage and battery replacement).
For other modules (i.e., the power module, PC CPU module, I/O module, special modules, etc.), refer to the appropriate User's Manual.

### 9.1 Unit Storage

The A1SD71 should be stored in the following environments:
(1) Ambient temperature 0 to $75^{\circ} \mathrm{C}$.
(2) Ambient humidity 10 to $90 \%$ RH.
(3) No condensation (e.g. due to sudden temperature changes).
(4) No direct exposure to sunlight.
(5) Free from excessive amounts of conductive powder such as dust, iron filings, oil mist, salt, or organic solvent.

A two hour "warming up" period should be allowed if the A1SD71 has not been powered up for over 12 months. (This is to allow the electrolyte in electrolytic capacitor to stabilize.) The battery should be replaced every 10 months if the unit is not powered up to maintain buffer memory data. (If the A1SD71 has not been used for 10 months or more, the data in the A1SD71 could be lost. In this case, it is necessary to check the set data.)

## 9. MAINTENANCE

### 9.2 Battery Change

### 9.2.1 Battery change frequancy

When the data backup battery voltage drops, the LED on the A1SD71 front panel is lit and an input signal (battery error) to the PC CPU is enabled. The battery is live for about one month more and, if it is not replaced, data will then be lost or corrupted.

Guide for preventive maintenance

1) The battery should be replaced every 4 to 5 years if it is only used for memory back up for a maximum of 300 days in that period.
2) Battery changing frequency for memory backup duty exceeding 300 days can be calculated as follows.

## Example

Assume that there are five operation days (10-hour operation and 14hour power-off during a day) and two power-off days in a week. Under these conditions, power-off period during one week is:

$$
\begin{aligned}
& 14 \text { (hours) } \times 5 \text { (days) }=70 \text { hours } \\
& 24 \text { (hours) } \times 2 \text { (days) }=48 \text { hours } \\
& 7200 \text { (hours) } /(70+48 \text { ) (hours) }=61 \text { (weeks) } \\
& 61 \text { (weeks) } \times 7 \text { (days) }=427 \text { (days) }
\end{aligned}
$$

Regarding one month as 30 days,
427 (days) $/ 30$ (days) $=14.2$ months
Hence,
it is necessary to change the battery every 14 months.

## REMARK

The same battery is used for all MELSEC-A series modules.
The battery can be stored for five years. The battery is guaranteed to work for 300 days in total.
The following battery is used. When replacing the battery, order from a Mitsubishi representative.
Product : Lithium battery
Model : A6BAT (with 3.6 V lead wire)
Precautions when handling the battery
(1) Do not short circuit the battery.
(2) Do not take the battery apart.
(3) Keep the battery away from fire.
(4) Do not heat the battery.
(5) Do not solder the electric poles.
(6) Do not measure the voltage using a tester. Otherwise, the capacity will be greatly lowered.

### 9.2.2 Battery replacement procedure

Fig. 9.1 shows how to replace the battery.

Fig. 9.1 Battery Replacement Procedure

## IMPORTANT

The components on the printed circuit board may be damaged by static electricity. When handling the printed circuit board:

1) Ground all tools, work bench, etc.
2) Do not touch the conductive areas or electrical components.

## APPENDICES

## APPENDIX 1 SIGNAL TIMING FROM THE A1SD71

### 1.1 Output Signal Timing

This section gives the output signal timing chart for positioning, operating in the speed control module, and zero return.

1) BUSY signals (X14, X15)
2) $\overline{\text { START }}$ (External start signal)
3) $M$ code $O N$ signals (X1E, X1F) (WITH)
4) Start processing complete signals (X18, X19)
5) $\overline{\text { PULSE (External field pulse) }}$
6) Positioning complete signals ( $\mathrm{X} 12, \mathrm{X} 13$ )
7) $M$ code $O N$ signals (X1E, X1F) (AFTER)
8) $\overline{\text { CLEAR }}$ (External clear signal)
9) Zero return request signals (X16, X17)
10) Zero return complete signals

|  | Positioning in the positioning control mode |  |  | Positioning in the switching mode |  | Positioning in the speed mode |  | Zero return |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | X axis | Y axis | Interpola tion | X axis | Y axis | X axis | Y axis | X axis | Y axis |
| $\mathrm{t}_{1}$ (msec) | 0.2 | 0.2 | 0.3 | 0.2 | 0.2 | 0.3 | 0.3 | 49.1 | 49.1 |
| $\mathrm{t}_{2}$ (msec) | 0.3 | 0.3 | 0.6 | 0.3 | 0.3 | - | - | - | - |
| $\mathrm{t}_{3}$ (msec) | 0.5 | 0.5 | 0.8 | 0.5 | 0.5 | 0.5 | 0.5 | 0.4 | 0.4 |
| 4 (msec) | 18.4 | 18.4 | 18.4 | 18.4 | 18.4 | 18.4 | 18.4 | 58.3 | 58.3 |
| $\mathrm{t}_{5}$ (msec) | - | - | - | - | - | - | - | 0.1 | 0.1 |
| $\mathrm{t}_{6}$ ( msec ) | - | - | - | - | - | - | - | 49.5 | 49.5 |
| $\mathrm{t}_{7}$ (msec) | 1.4 | 1.4 | 1.4 | 1.8 | 1.8 | 27.5 | 27.5 | 17.7 | 17.7 |
| $\mathrm{t}_{8}(\mathrm{msec})$ | - | - | - | - | - | - | - | 0.7 | 0.7 |
| t9 ( msec ) | - | - | - | - | - | - | - | 16.5 | 16.5 |

Note 1: Indicates the timing in the case of pattern (00) and pointer (0) for positioning in the positioning control mode.
Note 2: The timing when executing the zero return is given in 8) to 10) above.
Note 3: The dwell time when executing positioning is measured as " 0 ".

### 1.2 Start Delay Time

This section explains the time ( $\mathrm{t}_{0}$ ) required after turning ON the start signal until the A1SD71 BUSY signals (X14 and X15) go ON .
The following chart gives the timings for the start signal and BUSY signals.

(1) Variations in start processing times

Start processing times until a BUSY signal is turned on vary according to the following conditions:

1) Execution of the FROM/TO instruction during start processing

- If the FROM/TO instruction is executed, a delay up to several seconds could occur because the FROM/TO instruction takes priority.
- If a FROM/TO instruction is not executed, no delay will occur.

2) Operating state of the other axis

- If start processing is executed during the operation of the other axis, a delay of less than 100 msec will occur.
- If the other axis is not in use, no delay will occur.

3) Intervention by a peripheral device during start processing

- If a peripheral device intervenes, a delay of several msec will occur.
- When no peripheral device is connected, no delay will occur.

4) The number of speed change points in the positioning pattern in (11)

- As the number of speed change points in the positioning pattern in (11) increases, the delay is increased. (Approx. 10 msec per point)
(2) Start processing time (to)

Table 1.1 gives the measurement processing time under the following conditions with no delay resulting from the above items:

1) A FROM/TO instruction is not executed during the start processing.
2) The other axis is not in use.
3) No peripheral device intervenes.

Table 1.1 Start Processing Times

|  | Operating Mode |  | Min. Value of to <br> (maec) $* 1$ | Max. Value of to <br> (masec) $* 2$ |
| :---: | :--- | :--- | :---: | :---: |
| 1 | Zero return start | $5.5 \pm 5$ | $14 \pm 12$ |  |
| 2 | JOG start | $4.5 \pm 5$ | $33 \pm 12$ |  |
| 3 | Positioning control | Independent positioning <br> start | $15 \pm 5$ | $58 \pm 12$ |
|  | $61 \pm 5$ | $94 \pm 12$ |  |  |
| 4 | Positioning pattern (11) <br> Speed change <br> positioning continuation | Number of speed <br> change points: 4 | $61 \pm 5$ | $94 \pm 12$ |

*1: to becomes minimum when the $X$ or $Y$ axis starts under any of the following conditions:

1. After zero return has been completed.
2. After positioning has been completed.
3. After a current value has been changed.
*2: to becomes maximum when $X$ or $Y$ axis starts under any of the following conditions:
4. After zero return has been canceled.
5. After positioning has been canceled.
6. After an operation in the speed control mode.
7. After a JOG operation has been stopped.

Note (1): Feed pulses are output after the BUSY signals (X14 and X15) have been turned ON and to (msec) has passed (refer to Appendix 1.1).

## POINT

To not execute FROM/TO instructions during start processing, use the start signals (Y20 and Y21) for providing interlock to FROM/TO instructions.

### 1.3 A1SD71 Processing Times

The processing times for each pattern operation are as follows:

The above times do not include the processing time of the PC CPU, representing the estimated processing time of the A1SD71.

## APPENDIX 3 CONNECTION WITH SERVO MOTORS

There are several drive unit models and motors that can be used with the A1SD71. Examples of connections as of July 1986 are given. These examples shall be used only for reference because the driver's specifications are subject to change. Other drive units than described here can also be used.
[CAUTION]
(1) The A1SD71 output is a sink output pulse chain.

The drive unit should be sink input.
(2) For use with source input drive units, use the interface shown below.

(3) The A1SD71 pin numbers in parentheses are for the $Y$ axis.
(4) For other signal wires of the drive unit. Refer to the instruction manual for the corresponding drive unit.
(5) For connections to the A1SD71, use shielded twisted-pair cable.

### 3.1 Connection with Mitsubishi MELSERVO-A

A type output.

### 3.2 Connection with Mitsubishi MELSERVO-SO

Set the A1SD71 to A-type output.

### 3.3 Connection with Mitsubishi MELSERVO-SA

Set the A1SD71 to A-type output.

### 3.4 Connection with Mitsubishi MELSERVO-SC

Set the A1SD71 to A-type output.

### 3.5 Connection with Mitsubishi MELSERVO-J

Set the A1SD71 to A-type output.

### 3.6 Connection with Oriental's stepping motor

Set the A1SD71 with a motor to A-type output.

Note 1: Use shielded twisted-pair cable for wiring to the A1SD71.

### 3.7 Connection with Oriental's AC servo motor

Set the A1SD71 with a motor to A-type output.

### 3.8 Connection with Toei Electric's VELCONI-C

The connecting method to Toei Electric's VELCONI-C resolver-type positioning module LPR-ZA is shown below.
Set the A1SD71 to A-type output.

### 3.9 Connection with Nikki Denso's DIGITAL S-PACK

The connecting method to Nikki Denso's DIGITAL S-PACK NDS-300 is shown below.
Set the A1SD71 to A-type output.

### 3.10 Connection with Yasukawa Electric's PACK-10A and 16B

The connecting method to PACK-10A and 10B is shown below. Set the A1SD71 to B-type output.
Set the PULSE and SIGN to 5 V inside POSITION PACK.

## APPENDIX 4 OUTSIDE DIMENSIONS

## IMPORTANT

(1) Design the configuration of a system to provide an external protective or safety inter locking circuit for the PCs.
(2) The components on the printed circuit boards will be damaged by static electricity, so avoid handling them directly. If it is necessary to handle them take the following precautions.
(a) Ground human body and work bench.
(b) Do not touch the conductive areas of the printed circuit board and its electrical parts with and non-grounded tools etc.

Under no circumstances will Mitsubishi Electric be liable or responsible for any consequential damage that may arise as a result of the installation or use of this equipment.
All examples and diagrams shown in this manual are intended only as an aid to understanding the text, not to guarantee operation. Mitsubishi Electric will accept no responsibility for actual use of the product based on these illustrative examples.
Owing to the very great variety in possible applications of this equipment, you must satisfy yourself as to its suitability for your specific application.

[^0]:    M code consists of the code numbers ( 1 to 255) allocated by a user to execute auxiliary functions (for example, clamp, drill rotation, stop, and tool exchange command) after positioning control using an A1SD71.
    The PC CPU can execute specified auxiliary tasks by creating programs to go ON and OFF a relay ladder by using this $M$ code.

[^1]:    * Consult your nearest Mitsubishi representative about the connector.
