

FACTORY AUTOMATION

INVERTER FR-A800

Unparalleled Performance. Uncompromising Quality. [Addition of CC-Link IE TSN models]

- Approach to the leading drive performance
- Security & safety
- Easy setup& easy to use
- Eco-friendly factories
- System support

GLOBAL IMPACT OF MITSUBISHI ELECTRIC

Through Mitsubishi Electric's vision, "Changes for the Better" are possible for a brighter future.

Changes for the Better

We bring together the best minds to create the best technologies. At Mitsubishi Electric, we understand that technology is the driving force of change in our lives. By bringing greater comfort to daily life, maximizing the efficiency of businesses and keeping things running across society, we integrate technology and innovation to bring changes for the better.

Mitsubishi Electric is involved in many areas including the following

Energy and Electric Systems

A wide range of power and electrical products from generators to large-scale displays.

Electronic Devices

A wide portfolio of cutting-edge semiconductor devices for systems and products.

Home Appliance

Dependable consumer products like air conditioners and home entertainment systems.

Information and Communication Systems

Commercial and consumer-centric equipment, products and systems.

Industrial Automation Systems

Maximizing productivity and efficiency with cutting-edge automation technology.

Unparalleled Performance. Uncom

What is required of inverters in this constantly changing world?

At Mitsubishi Electric, we have pursued the answer to this question through constant innovation and evolution.

Introducing our extensive range of high-value,

next-generation inverters delivering outstanding drive performance in any environment,

and a wealth of functionality covering startup to maintenance.

We utilized the traditional Mitsubishi Electric philosophy to further perfect our inverters.

The enhanced Real sensorless vector control and vector control serve the needs of all machinery types.

SECURITY & SAFETY

Rapid response is obtained when an unexpected trouble occurs.

EASY SETUP & EASY TO USE

Fully equipped with a variety of simple functions and equipment to improve work efficiency.

ECO-FRIENDLY FACTORIES

Save energy while increasing factory production.

SYSTEM SUPPORT

Numerous functions and the extensive lineup of models are ready to support various systems.

promising Quality.

APPROACH TO THE LEADING **DRIVE PERFORMANCE**

The new series is equipped with the new state-of-the-art high-speed processor developed by Mitsubishi Electric. With better control performance and response level, safe and accurate operation is assured in a diverse range of applications.

Swift, Smooth, yet Robust

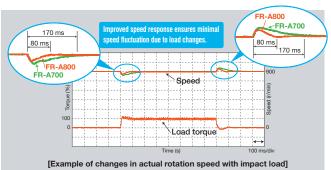

The enhanced Real sensorless vector control and vector control serve the needs of all machinery types.

The vector control is available when a vector control compatible option is installed.

For high-quality products

High response

Response speed Real sensorless vector control 50 Hz*1 A700: 20 Hz Vector control 130 Hz*2 A700: 50 Hz

Fast response terminal

Terminal response

A700: 5 to 20 ms A800: 2 to 3 ms

Line control

Line control is necessary for the machining of elongated products such as paper, thread, wires, all kinds of sheet, and tape. This will respond rapidly to changes in line speed and suppress the occurrences of winding unevenness This contributes to a steady supply of high-quality products.

- :At 3.7 kW with no load. Differs depending on the load conditions and motor capacity
- 2: The option (FR-A8AP, FR-A8AL, or FR-A8TP) is required.

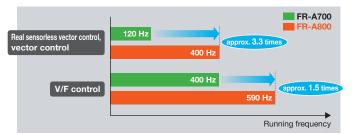

Speed response: The speed response indicates how fast the inverter follows the change in the speed command. (The larger value indicates the better speed trackability.)

(2) Perform ultra-fine processing

High-speed rotation

Real sensorless vector control and vector control 400 Hz A700: 120 Hz

V/F control 590 Hz*3 A700: 400 Hz

Machine tool

Cutting-edge machine tools are harder and thinner than ever before to be applicable to diverse new

High-speed rotation is required more than ever before in order to be applicable for fine and precise cutting on hard and difficult-to-grind materials.

According to the review result of the export control order about frequency changers, the upper limit of output frequency was determined to be 590 Hz for standard models.

(3) Swiftly move heavy weights

High torque at low speed

Starting torque (When at 0.3 Hz) Real sensorless vector control 200% (ND rating)*4,

Vector control 200% (ND rating)*4

(150% of initial setting for 5.5K and higher)

Zero-speed torque

Vector control 200%. (Select HD rating.)*4

Speed control range

V/F control 1:10 (6 to 60 Hz: Driving)

Advanced magnetic flux vector control 1:120 (0.5 to 60 Hz: Driving) Real sensorless vector control 1:200 (0.3 to 60 Hz: Driving) Vector control 1:1500 (1 to 1500 r/min: Both driving/regeneration)

200 150 [Example of speed-torque characteristics with Real sensorless vector control] When offline auto tuning is performed for the SF-PR 4P motor (15 kW). In the low-speed range, the torque increases by the increased magnetic excitation. Torque characteristics in the low-speed range can be set in the parameters.

Cranes

Cranes are in operation daily at ports carrying fully-laden containers in response to strong demand from all over the world. Our new inverter realizes smooth cargo handling work at low speed and high torque for the slow and stable movements required for heavy objects.

*4: Refer to page 17 for the multiple rating setting.

(4) For accurate and stable transport between machines

PM sensorless vector control

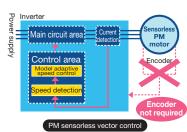

What is a permanent magnet (PM) motor?

A PM motor is a synchronous motor with strong permanent magnets embedded in its rotor. The two major PM motor types are: the interior permanent magnet (IPM) motor with its magnets embedded inside the rotor, and the surface permanent magnet (SPM) motor with its permanent magnets attached on the rotor surface.

What is PM sensorless vector control?

The speed and magnetic pole positions, the two essential bits of information to control a PM motor, are detected without a sensor (encoder). The speed detection internally-performed in an inverter enables highly accurate control of a PM motor, almost as

accurate as an AC servo system, without the need of a sensor (encoder)*5. Combining with Mitsubishi Electric MM-CF series IPM motors facilitates aspects of high-level control with no encoder such as "simple positioning"*6 and "zero speed torque".

Easy maintenance for sensor (encoder)-less motor

- •No additional cables means less wiring space required.
- •Improved reliability is obtained in unfavorable operating environments. (e.g. high vibration)
- •PM motors are usually smaller and lighter than induction motors.

Comparison of SF-PRF 1.5 kW 4P and MM-CF152

The Simple positioning control delivers a precision workpiece such as a printed substrate, to a precise position. Transfer of fragile glass substrates

- 5: Speed fluctuation ratio: ±0.05% (digital input) Speed fluctuation ratio = Speed under no load - Speed under rated load ×100(%) Rated speed
- *6: Positional accuracy (with no load) of 1.5K and lower: ±1.8°, 2K and higher: ±3.6°

(5) Taking motor performance to the max

Induction motors and magnet motors can be combined freely

The cutting-edge auto tuning function

The PM motor auto tuning function, which has been newly developed, enables sensorless operation of other manufacturers' permanent magnet (PM) motors.

Operation with all Mitsubishi Electric induction motors and PM motors, in addition to induction motors and PM motors from other manufacturers*7, is possible. That means you need less motors for spare and stocks.

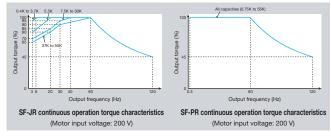

(With IPM motors other than MM-CF and PM motors manufactured by other companies, starting torque is limited to 50%, and simple positioning control and zero speed torque cannot be used even if tuned.)

*7: Tuning may not be available depending on its motor characteristics.

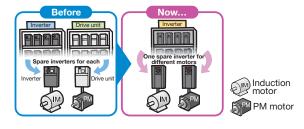

Low speed, high torque realized with SF-PR motor

By combining with Mitsubishi Electric's high-performance, energy-saving motor SF-PR, 100% continuous operation is possible from a low speed of 0.3 Hz for inverters of any capacity. (when using Real sensorless vector control)

Sharing the spare inverter

One spare inverter is enough for the two types of motors (IM and PM).

SECURITY & SAFETY

Swift recovery ensured by preventing trouble beforehand. The FR-A800 has been developed with reliability and safety foremost in mind.

For Improved Equipment Reliability

Rapid response is obtained when an unexpected trouble occurs.

Improved system safety

Safety standards compliance NEW

Controls with safety functions can be easily performed. The Safe Torque Off (STO) safety function is supported by the inverter. The inverter with the safety function can comply with the safety standards without incurring much expenses.

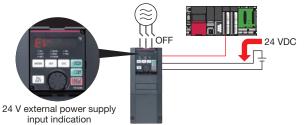

- PLe and SIL3 are supported as standard.
- •ISO13849-1:2015 Category 3/PLe
- •IEC62061:2015 / IEC61800-5-2:2016 / IEC61508:2010 SIL3

(2) Reliable and secure maintenance

Standard 24 VDC power supply for the control circuit **NEW**

In addition to the existing power supply input terminals (R1 and S1) of the control circuit, 24 VDC input is equipped as standard. The 24 VDC power supplied from outside can be fed to the control circuit locally, enabling the parameter settings, communication operation and safety maintenance without turning ON the main power.

Prevention of trouble with temperature monitoring **NEW**

The inverter is equipped with an internal temperature sensor, which outputs a signal when the ambient temperature is high. This facilitates the detection of rises in temperature inside the inverter following cooling fan malfunction, or rises in ambient temperature due to inverter operating conditions.

(3) Long life components and life check function

Long life components

- The service life of the cooling fans is now 10 years*3. The service life can be further extended by ON/OFF control of the cooling fan.
- •Capacitors with a design life of 10 years*3*4 are adapted. With these capacitors, the service of the inverter is further
- Estimated service lifespan of the long-life parts

Components	Estimated lifespan of the FR-A800 ***	Guideline of JEMA ⁶⁵
Cooling fan	10 years	2 to 3 years
Main circuit smoothing capacitor	10 years*4	5 years
Printed board smoothing capacitor	10 years*4	5 years

- *3: Surrounding air temperature: Annual average of 40°C (free from corrosive gas, flammable gas, oil mist, dust and dirt).
- The design life is a calculated value from the LD rating and is not a guaranteed product life. 4: Output current: 80% of the inverter LD rating
- *5: Excerpts from "Periodic check of the transistorized inverter" of JEMA (Japan Electrical Manufacturer's Association).

Enhanced life diagnosis function

diagnosis. **NEW**

- An internal thermal sensor is equipped to all inverters as standard, which enables monitoring of the installation environment. Use this function as a guide for the life
- Maintenance timers are available for up to three peripheral devices, such as motor and bearing.

"Maintenance 1 output' warning

(4) Quick reaction to troubles

Easy fault diagnosis **NEW**

•The operating status (output frequency, etc.) immediately before the protection function activates can be stored in the inverter built-in RAM with the trace function. The stored data (trace data) can be copied to a USB memory device or directly imported to a computer, facilitating trouble analysis using the inverter setup software (FR Configurator2).

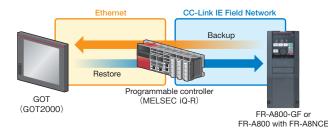

Trace data stored in the built-in RAM is deleted when the power is turned OFF or the inverter is reset.

•Clock setting is now available in addition to the already-available cumulative energization time. The time and date at a protective function activation are easily identified. (The clock is reset at power-OFF.) The date and time are also saved with the trace data, making the fault analysis easier. By using the real-time clock function with the optional liquid crystal display (LCD) operation panel (FR-LU08) (when using battery), the time is not reset even when the power supply is turned OFF.

Backup/restore **NEW**

•The GOT can be used for backing up inverter's parameter settings and the data used in the PLC function of inverter, and the backup stored in the GOT can be used to restore the data in the inverter.

(5) Renewal assurance

Intercompatibility with existing models

•The inverter installation method is the same as that for the FR-A700 series, eliminating any concerns over replacement. Furthermore, FR-A700 series control circuit terminal blocks can be installed with the use of an option (FR-A8TAT).

•The conversion function of Inverter Setup Software (FR Configurator2) enables parameter copy from an FR-A700 and even from an FR-A500 (to be supported soon).

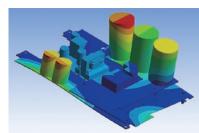

For the compatibilities and differences with the FR-A700 series, refer to page 245.

(6) Reasons for high quality

Design considering the hazardous environment

3D-vibration analysis is performed to confirm the vibration resistance. The analysis is also useful to find the best layout position and to further improve the product's rigidity.

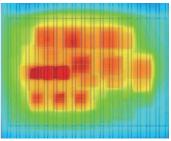

Assuming a hazardous service condition, the product reliability is thoroughly assessed in the design stage. Every effort is made to ensure the best quality of the Mitsubishi Electric inverter.*6

3D-vibration analysis

Heat control for high quality

Resistance against heat is what makes an inverter reliable. A well-designed heat-resistant power module is essential in a reliable inverter. From the power module's design stage, its heat resistance is carefully considered.*6

Hydraulic analysis and heat simulation

^{*6:} The usage beyond the product's specified service condition is not guaranteed.

EASY SETUP & EASY TO USE

A range of equipment and functions are prepared allowing work to be performed anywhere to suit product life cycles.

From Startup to Maintenance

Fully equipped with a variety of simple functions and equipment to improve work efficiency.

Streamlining the startup process

Parameter copying with USB memory NEW

 A USB host connecter (A type), which allows external device connections, has been added.

Parameters can be copied to commercial USB memory devices. (Refer to page 69)

USB 2.0 (full speed) supported

Easy setup with the Inverter Setup Software (FR Configurator2)

- •It is a software which is easy to use and has unity as Mitsubishi Electric FA products with MELSOFT common design and good operability.
- · Easy plug-and-play connection to USB terminal equipped as standard

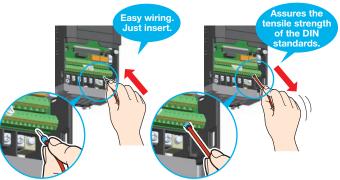

•Free trial version, which contains start-up functions, is available. It can be downloaded at Mitsubishi Electric FA Global Website.

For FR Configurator2, please refer to page 30.

Easy wiring to the control circuit **NEW**

Spring clamp terminals have been adopted for control circuit terminals. Wires can be protected against loosening under vibrations during transportation of the inverter. Ten additional terminals are used as compared to the FR-A700 series. Round crimping terminals can also be used by employing a control terminal option (FR-A8TR).

(2) Easy-to-follow display improves the operability

Easy operation with GOT NEW

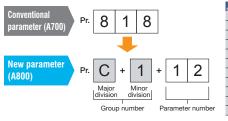

- Automatic communication is possible without specifying any parameter settings simply by connecting to the GOT2000 series.
- •The PLC function device monitor can be displayed at the GOT2000 series. Batch control of multiple inverter device monitors is possible with a single GOT unit.

•The sample screen data for the A800 can be found in the screen design software of the GOT2000 series. The newest version of the screen design software can be downloaded from the Mitsubishi Electric FA Global Website.

Easy-to-follow parameter configuration **NEW**

One of the selectable mode by the operation panel is the Group parameter mode, which provides intuitive and simple parameter settings. (The conventional parameter setting mode is selected by default.)

	Major division	Name
	E	Environment
	F	Acceleration/deceleration
	D	Start and frequency commands
	Н	Protective function
	M	Monitor
]	Т	Multi function I/O terminal
	С	Motor constant
	Α	Applications
	В	Applications (position control)
J	N	Communication
er	G	Control

Easy-to-read operation panel **NEW**

A 5-digit, 12-segment display has been adopted for the operation panel (FR-DU08) for a more natural character display. Furthermore, an optional LCD operation panel (FR-LU08) adopting an LCD panel capable of displaying text and menus is also available.

FR-DU08 (12-segment type)

(3) To aid with maintenance

Reduced wiring check time

Split-type covers are adapted for all capacity models.

Maintenance is now easy because all an operator has to do is to remove the cover for the target wiring area.

Maintenance and control of multiple inverters (Option) **NEW**

Serial number reading is possible using the optional LCD operation panel (FR-LU08) or the Inverter Setup Software (FR Configurator2). Administration of different inverters has become much more simple.

ECO-FRIENDLY FACTORIES

The power consumption by motors is said to amount about the half of all power consumption made by the Japanese manufacturing industry. Factories can save more energy without dropping their production. Less energy and more production—the FR-A800 series will help you to get the both.

The Next Step — Go Green

Save energy while increasing factory production.

(1) Energy-saving function tailored to system, application

Variety of functions

- Check the energy saving effect at a glance
- You can check the energy saving effect on the energy saving monitor.
- •The measured output power amount can be output in pulses.
- Reduce power consumption during standby
- Control circuits other than those for power-related parts can be operated with 24 VDC power supplied from an external power source.
- Since the control circuit can use the external 24 VDC, other power control circuits can stay OFF while no driving is required, and that saves the standby energy.
- By turning the cooling fan ON/OFF based on the inverter status, wasteful power consumption during stoppages can be reduced.

Save energy with Optimum excitation control NEW

The excitation current is constantly adjusted to drive the motor in the most efficient method which leads to energy saving. For example, with optimum excitation control with motor load torque of 10% when using the SF-JR, motor efficiency has increased by approximately 15% over the previous V/F control method.

Effective use of regenerative energy (option)

Multiple inverters can be connected to the power regeneration common converter (FR-CV)/high power factor converter (FR-HC2) via a common PN bus.

Regenerative power is used at other inverters, and surplus energy is returned to the power supply, resulting in energy saving. The 315K or higher models are inverter-converter separated types, which are suitable for power regeneration.

(2) PM motor contributes to the energy saving in factories

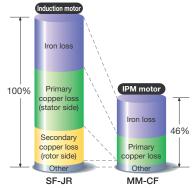

PM motor

If the inverter is being used for an application requiring constant-torque, such as a conveyor, factory energy savings can be achieved by replacing your current induction motors with permanent magnet motors (PM motors).

(Tuning is required for an IPM motor other than MM-CF, and for the PM motors of other manufacturers.)

Why is a PM motor so efficient?

- •The current does not flow to the rotor (secondary side), so there is no secondary copper loss.
- Magnetic flux is generated by permanent magnets, so less current is required to drive a motor.

[Comparison of motor losses] (Example of 1.5 kW motors)

Conveyor

A conveyor transports different goods and products according to its application. A PM motor can keep the carrying speed constant while saving energy.

SYSTEM SUPPORT (NETWORK)

Further Visualization of Information

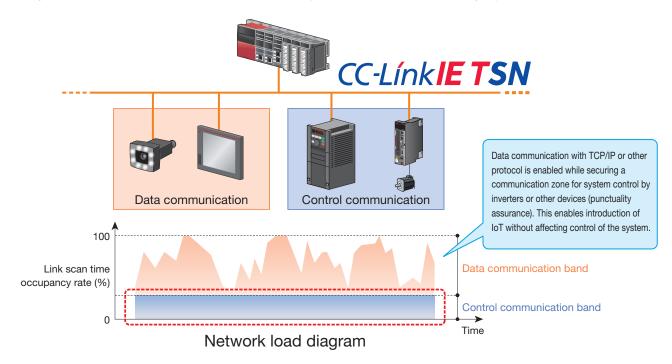

A seamless data interface is offered.

Ethernet communication function integrated

Inverter with communication function **NEW**

FR-A800-GN CC-Link E TSN

With the CC-Link IE TSN (Time Sensitive Networking) communication function, data can be transmitted to IT systems while performing real-time cyclic communication control. This will contribute to startup time reduction and maintainability improvement.

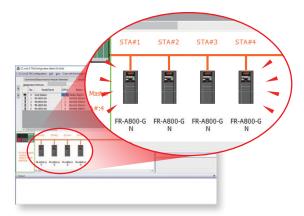

Startup time reduction

Station numbers are easily set with rotary switches.

Automatic detection of the network configuration by the engineering software (GX Works3) reduces the startup time.

Problems at startup such as line faults can be discovered at a glance with the diagnostic function.

Example of GX Works3 screen

Improved maintainability

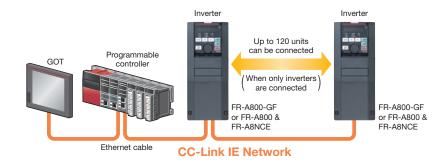

Time synchronization allows for real-time monitoring.

This enables trouble analysis to be performed right after an error has occurred.

FR Configurator2 can be connected via Ethernet, which makes maintenance work easier.

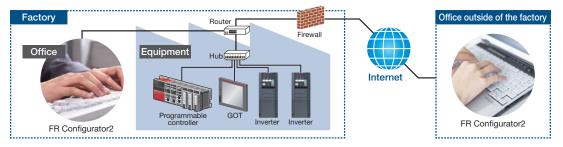

FR-A800-GF CC-LÍNK Field

The inverter has the CC-Link IE Field Network communication function, which enables immediate operation via the CC-Link IE Field Network.

FR-A800-E CC-l ink E Field Basic

The CC-Link IE Field Network Basic is supported, so the network can be created easily. The inverter's status can be monitored and the parameters can be set via Internet. (MODBUS/TCP is also supported.)

CC-Link family compatible with the FR-A800 series inverters

Item		CC-Línk IE TSN	CC-Línk IE E ield	CC-Línk IE E ield Basic	CC-Link
Compatible inv	ortor	FR-A800-GN,	FR-A800-GF,	FR-A800-E	FR-A800 & FR-A8NC

lopology		line-star	line-star	Star	bus

- *1: The actual number of connectable inverters differs according to the setting of the master
- 2: The numbers of inverter's remote I/O devices and the addresses of inverter's remote registers are common between CC-Link and CC-Link IE Field Network Basic.
- *3: Ring topology will be supported later.

(2) Other network communication

Communication option

- •CC-Link, SSCNET III (/H), DeviceNet™, PROFIBUS-DPV0 are supported using a compatible communication option. Other Ethernet-based communication such as the CC-Link IE Field Network communication and the FL remote communication can be also supported.
- •A function block (FB) programming for CC-Link communication is available for the MELSEC-Q/L series to create the inverter control sequence programs easily. (The FB library (collection of FB elements) can be downloaded from the Mitsubishi Electric FA Global Website.)
- •The standard model with an RS-485 interface (Mitsubishi inverter protocol, MODBUS® RTU protocol) enables communication with other devices without using a communication option.

SYSTEM SUPPORT (ENVIRONMENT ADAPTABILITY)

Installation Anywhere

Compliant with a variety of standards, our extensive range of the FR-A800 series inverter covers various applications.

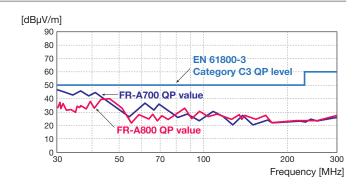

(1) Comprehensive noise countermeasures

Compliance with EU EMC Directive with inverter alone

Troublesome acquisition of standards is unnecessary.

- The FR-A800 series is equipped with an EMC filter as standard for compliance with EMC Directive with the inverter alone.
 (EN 61800-3 2nd Environment Category C3)
- •The newly developed drive technology and the power supply technology minimize the EMI emitted from inverters.

	Capacitive filter (radio noise filter)	Input-side common mode choke (line noise filter)	DC reactor	
55K or lower	Standard (built-in)	Standard (built-in)	Option (sold separately)	
75K or higher	Standard (built-in)	Option (sold separately)	Option (sold separately)	

(2) Global compatibility

Compliance with a variety of standards

- Complies with UL, cUL, and EC Directives (CE marking), and the Radio Waves Act (South Korea) (KC marking). It is also certified as compliant with the Eurasian Conformity (EAC).
- •The inverters are compliant with the EU RoHS Directive (Restriction of the Use of Certain Hazardous Substances in Electrical and Electronic Equipment), friendly to people and to the environment.
- •For the 400 V class*1, compliance with various countries ship classifications allows use on ship equipment. (A noise filter is required for the FR-A840 inverter and the FR-CC2 converter unit, and a ferrite core is required for the FR-A846 inverter. (Refer to page 210.))

	Certification body
NK	(Nippon Kaiji Kyokai)
ABS	(American Bureau of Shipping)
BV	(Bureau Veritas)
LR	(Lloyd's Register of Shipping)
DNV GL	(DNV GL AS)
CCS	(China Classification Society)
KR	(Korean Register of Shipping)

^{*1:} The IP55 compatible model with a built-in C3 filter is not compliant with the ship classification standards.

For details of the models compliant with global standards, contact your local sales office.

(3) Protected in hazardous environment

Circuit board coating

The inverters with PCB coating (IEC60721-3-3 3C2/3S2) and conductive plating are available for improved environmental resistance. ("-60" or "-06" is affixed to the end of the inverter model name.)

(4) Wire saving, space saving

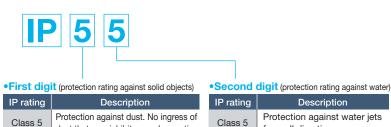

Built-in brake transistor **NEW**

In addition to the 22K and lower, 400 V class 30 to 55K models have also been equipped with a built-in brake transistor. In an application where the motor is hardly decelerated, connecting a brake resistor can shorten the deceleration time; no brake unit or power regeneration converter is required. Wiring, space, and ultimately the cost will be all saved.

(5) Direct installation by the machine

IP55 compatible **NEW**

- •Inverters can be installed nearby the machine, minimizing cable length between the inverter and motor.
- Support is available for use even in high-humidity or dusty environments, facilitating a more flexible choice of installation locations.
- •By enclosing a DC reactor, it requires less wiring and less space.
- Compatible with cable glands to meet the IP55 specification at the wiring section.

from all directions.

(6) Flexible configuration to meet the needs

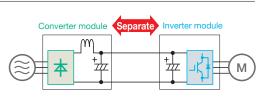

Separate inverter and converter modules **NEW**

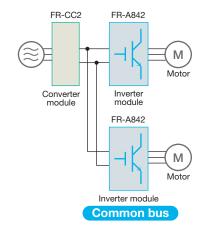

dust that may inhibit normal operation.

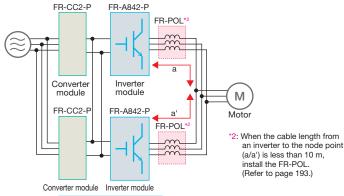

The inverter module and the converter module are physically separated for the 315K or higher capacity models.

Inverter module : FR-A842 Converter module : FR-CC2

This facilitates flexible support for a variety of systems such as common bus line (to be supported soon) and parallel operation. The fuse in the FR-A842 inverter eliminates the need of a fuse between terminals P/+ and N/-. These features allow the installation space to be minimized and costs to be reduced. The converter unit can be run with 12-phase rectifier power supply. Motors up to 1350 kW (LD rating) can be driven by the inverters with parallel operation function (FR-A842-P) and the converter units (FR-CC2-P).

Parallel operation Some functions from the standard inverter are limited or not available. (Refer to page 248.)

SYSTEM SUPPORT (FUNCTION)

High Equipment Functionality

Numerous functions and the extensive lineup of models are ready to support various systems.

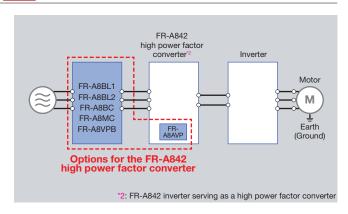

(1) Turn spare inverters into converters

Changeover between inverter and high power factor converter **NEW**

Install the FR-A8AVP (option) in a separated converter type inverter to use it as a high power factor converter. To use the converter, the following options are needed: phase detection transformer box, dedicated filter reactor, dedicated reactor for PWM control, dedicated filter capacitor, inrush current limit resistor, etc. They can be switched to a converter and back to an inverter again to match process requirements.

The converter is classified as the self-excitation three-phase bridge circuit, and achieves K5 (the conversion factor) = 0. The total harmonic distortion of the input current (THDi) is 5% or less¹¹, which facilitates compliance with the overseas standards related to harmonic suppression.

*1: When the input voltage is distorted, harmonic contents increase because power harmonics flow into the converter.

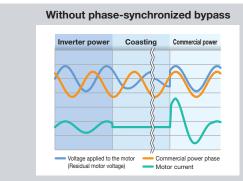

(2) Reduce the shock caused by switching the power source

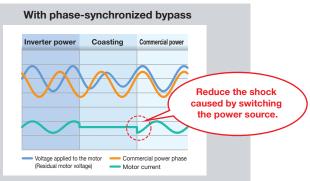

Phase-synchronized bypass switching (400 V class only) **NEW**

The FR-A8AVP (option) and the FR-A8VPB (option) make it possible to detect the phase of the commercial power supply. (For wiring details, refer to page 186.)

By synchronizing the inverter output with the phase of the commercial power supply, the spike in the motor current can be suppressed and shock reduced.

Furthermore, the time required for the switching is reduced, which is more beneficial for larger inverters.

(3) Reduced tact time with functionality suited to the application

Anti-sway control **NEW**

When an object is moved by a crane, swinging at the time of stopping is suppressed on the crane's transverse axis or traveling axis. This control cuts down the tact time and facilitates efficient operation.

Increased magnetic excitation deceleration **NEW**

Deceleration time can be reduced without a brake resistor. Tact time can be eliminated at conveyor lines, etc.

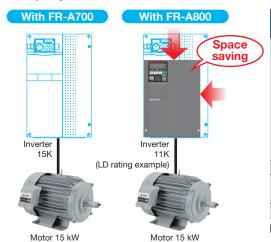

(4) Selection of optimum capacity to suit the application

Multiple rating **NEW**

Rated current and four different overload capacity ratings (SLD rating (super light duty), LD rating (light duty), ND rating (normal duty), HD rating (heavy duty)) can be selected with parameters. The optimum inverter can be selected to suit the application, and by selecting an inverter with SLD or LD rating, equipment size can be reduced when compared with the FR-A700 series. The HD rating is best suited for applications requiring low speed and high torque.

If using an inverter with capacity of 75K or higher, or motor with capacity of 75 kW or higher, always select and install the inverter based on the capacity of the motor with DC reactor.

Rating	SLD	LD	ND	HD
riating	Super light duty	Light duty	Normal duty	Heavy duty
		Fan and Pump		
Application		Tunnel Borin Winding and Unwindi	g Machines, ng, Printing Machines	
Application			Cranes	, Press
			Conveyor	
Pr.570 (E301) setting	0	1	2 (Initial value)	3
Overload current rating (inverse-time characteristics)	110% 60 s, 120% 3 s	120% 60 s, 150% 3 s	150% 60 s, 200% 3 s	200% 60 s, 250% 3 s
Surrounding air temperature	40°C	50°C	50°C	50°C

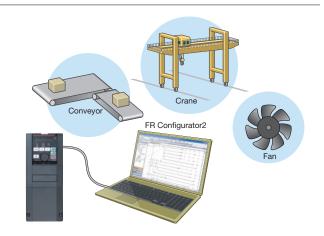

Refer to page 16 for the inverter rating selection.

(5) PLC control with an inverter

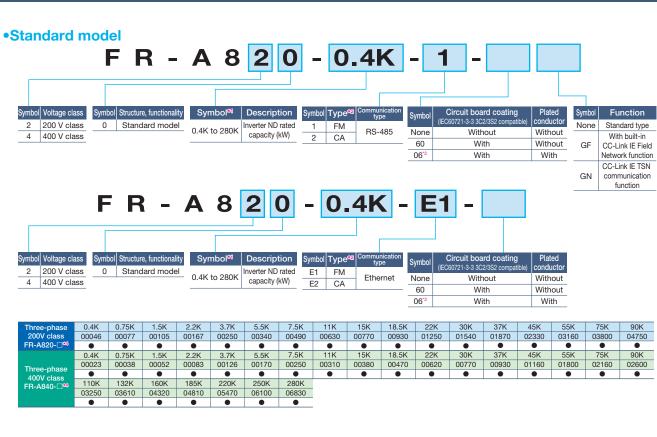

Built-in PLC function in an inverter **NEW**

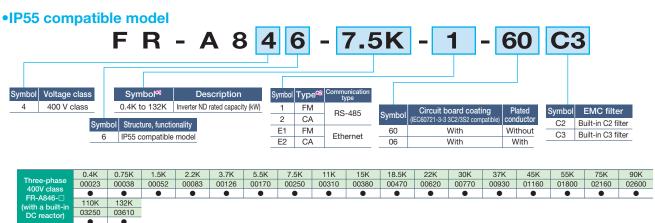

- Parameters and setting frequency can be changed at the program.
- Inverter control such as inverter operations triggered by input signals, signal output based on inverter operation status, and monitor output can be freely customized based on the machine specifications.
- •All machines can be controlled by the inverter alone, and control can also be dispersed.
- Time-based operation is possible by using in combination with the real-time clock function (optional LCD operation panel (FR-LU08)).
- •The FR-A800-E enables communication between multiple inverters using the I/O devices and special registers of the PLC function, which can create a small-scale system by Ethernet using the inverter-to-inverter link function.

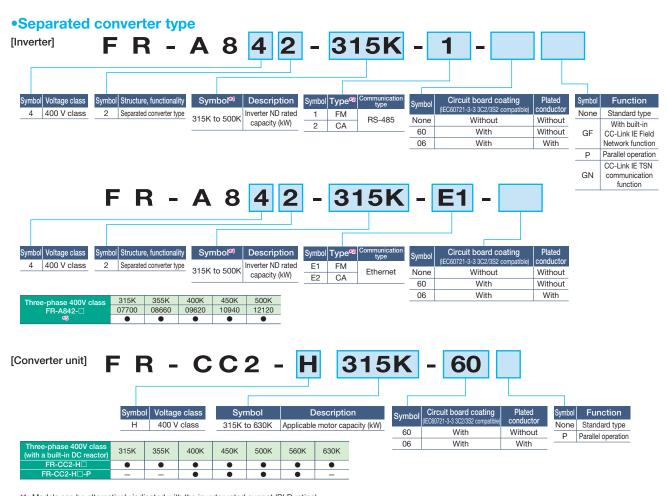

Refer to page 28 for the details.

Extensive lineup For the details of the lineup, please contact your sales representative.

1: Models can be alternatively indicated with the inverter rated current (SLD rating).

(For the FR-A842-P and the FR-A846, the current rating is LD or ND. However, the rated current used to represent the model is the SLD rated current of the standard model.)

2: Specification differs by the type as follows.

Time	Monitor output			Initial setting	
Type	Monitor output	Built-in EMC filter	Control logic	Rated frequency	Pr.19 Base frequency voltage
FM	Terminal FM (pulse train output)	OFF	Sink logic	60 Hz	9999
(terminal FM equipped model)	Terminal AM (analog voltage output (0 to ±10 VDC))	011	Of 1 Silik logic		(same as the power supply voltage)
CA	Terminal CA (analog current output (0 to 20 mADC))	ON	Source logic	50 Hz	8888
(terminal CA equipped model)	Terminal AM (analog voltage output (0 to ±10 VDC))	ON	Source logic	30 HZ	(95% of the power supply voltage)

- *3: Available for the 5.5K or higher.
- *4: For using the 75K or higher inverter and a 75 kW or higher motor, always install a DC reactor (FR-HEL), which is available as an option.
- *5: Always install the converter unit (FR-CC2(-P)). (Not required when a high power factor converter (FR-HC2) is used.)

Overload current rating

SLD	110% 60 s, 120% 3 s (inverse-time characteristics) at surrounding air temperature of 40°C
LD	120% 60 s, 150% 3 s (inverse-time characteristics) at surrounding air temperature of 50°C
ND	150% 60 s, 200% 3 s (inverse-time characteristics) at surrounding air temperature of 50°C
HD	200% 60 s, 250% 3 s (inverse-time characteristics) at surrounding air temperature of 50°C

^{*1:} The applicable motor capacity is the maximum applicable capacity of a Mitsubishi Electric 4-pole standard motor.

Dedicated inverter for specialized field

FR-A800 Plus

Series

FR-A800-CRN

Reduction in tact time

Specialized functions such as anti-sway control facilitate efficient operation.

Load slippage prevention

Optimum brake operation is obtained. It is possible to detect the slippage at a start of operation.

Dedicated monitoring functions

Overload detection and start time counting are possible.

Easier maintenance

Protection against vibration, dust and dirt, or corrosion is also available.

A800 Plus

A new lineup of dedicated inverters for specialized fields are born!

Plus! The optimum functions for each dedicated field are added to the already high performance and high functionality FR-A800 series inverter.

System simplification

Winding/unwinding can be stabilized by the inverter alone.

Easy startup and adjustment

Parameters can be used for mechanical adjustment according to applications.

Wide range of applications

The inverter offers four types of control functions which enables the use in various system applications such as winding/unwinding in the wire drawing machines and printers.

A MINES

FR-A800-LC

Effective solution for downsizing of the enclosure

Liquid cooling enables installation of the cooling system outside of the enclosure.

Dedicated monitoring functions

The coolant flow is monitored for quick detection of system faults.

Dedicated inverter for specialized field

FR-A800 Plus

Series

Pursuing optimum functions to meet our customers' needs

A lineup of dedicated inverters for specialized fields are offered.

Plus! The optimum functions for each dedicated field are added to the already high performance and high functionality FR-A800 series inverter.

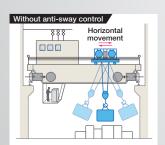

Optimum functions for cranes

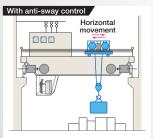

FR-A800-CRN

The inverter has various functions ideal for a crane application such as reduction in tact time, load slippage prevention, etc.

Reduction in tact time

By using the Mitsubishi Electric's original anti-sway control technology, the swinging of an object moved by a crane is suppressed at the time of stopping, even without operator's input adjustment. This control cuts down the tact time and facilitates efficient operation.

Load slippage prevention

- The highly scalable brake sequence function enables the output of a brake opening signal for the optimum brake operation calculated from the load torque or the speed.
- Slippage during the start of a lift can be checked.
 (A speed detector such as an encoder is required.)

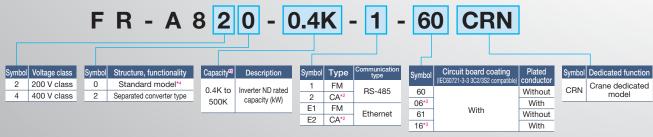

Dedicated monitoring functions

- A signal can be output when too much load is applied.
- The inverter starting times can be counted to determine the timing of the maintenance.

Easier maintenance

- A strong vibration may occur in some operating conditions, for example, during the crane traveling. Inverters with enhanced vibration resistance are available. They have components fixed to the circuit board with adhesive and wires that are tied in place with cable ties.
- Using the inverter in a dusty environment may cause faults such as a short circuit. Inverters with circuit board coating (conforming to IEC 60721-3-3 3C2/3S2) and plated conductors are available for improved environmental resistance.

Model

- *1: Models can be alternatively indicated with the inverter rated current (SLD rating).
- *2: For the CA type, the monitor output terminal F/C operates as terminal CA (analog current output: 0 to 20 mADC), not as terminal FM (pulse train output).
- *3: Available for the 5.5K or higher.
- *4: For the 75K or higher inverter, or whenever a 75 kW or higher motor is used, always connect a DC reactor (FR-HEL), which is available as an option.

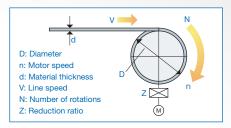

Optimum functions for roll to roll applications

FR-A800-R2R

The inverter can be used in a wide variety of systems with various dedicated functions. High productivity can be achieved by stable tension control.

System simplification

The FR-A800-R2R inverter has various dedicated functions such as winding diameter calculation, providing stable winding/unwinding control independently.

Easy startup and adjustment

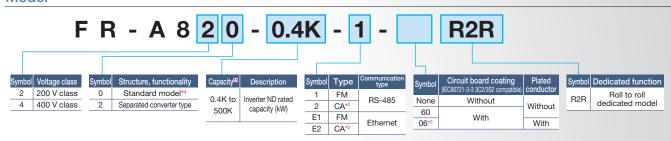

- Mechanical adjustment according to applications can be achieved just by setting parameters, which enables the startup and adjustment work of the system by the inverter alone.
- Tension PI gain tuning: By automatically adjusting the tension PI gain for PID control, the time required for adjustment is significantly cut down.

Wide range of applications

The inverter offers four types of control functions which enables the use in various system applications such as winding/unwinding in the wire drawing machines and printers.

- Dancer feedback speed control
- Tension sensor feedback speed control
- Tension sensorless torque control
- Tension sensor feedback torque control

Model

Inverter model	Inverter capacity
FR-A820	0.4kW to 90kW
FR-A840	0.4kW to 280kW
FR-A842	315kW to 500kW

- *1: Models can be alternatively indicated with the inverter rated current (SLD rating).
- *2: For the CA type, the monitor output terminal F/C operates as terminal CA (analog current output: 0 to 20 mADC), not as terminal FM (pulse train output).
- *3: Available for the 5.5K or higher.
- *4: For the 75K or higher inverter, or whenever a 75 kW or higher motor is used, always connect a DC reactor (FR-HEL), which is available as an option.

Liquid Cooled Type Inverter

FR-A800-LC

Coolant is used for cooling the inside of the inverter. Liquid cooling enables the use of inverters for tunnel boring machines or chillers in the environments where heat is difficult to be dissipated.

Effective solution for downsizing of the enclosure

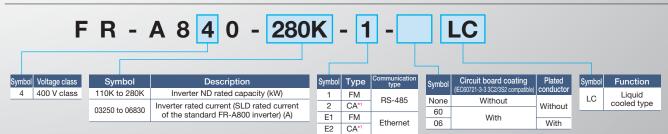

A smaller enclosure can be used since the quantity of the heat dissipated in the enclosure is reduced.

Dedicated monitoring functions

A sensor (flow switch) is attached at the inlet of coolant to send a signal to the inverter. When the coolant flow rate decreases, a warning is output, enabling quick, direct detection of system faults.

Model

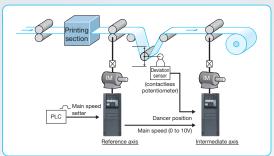

^{*1:} For the CA type, the monitor output terminal F/C operates as terminal CA (analog current output: 0 to 20 mADC), not as terminal FM (pulse train output).

Application example

BEST SUITED FOR EVERY MACHINE

Line Control (Winding and Unwinding)

Material tension is kept constant by employing speed control and torque control to eliminate slack and uneven winding. By using a motor with the speed ratio most appropriate for the machine, the inverter capacity can be downsized.

Typical industries

Textile industry

Steel industry

Pulp, paper, paper products manufacturing industries

Dancer control NEW

The dancer control detects the dancer roll positions and performs PID operation to keep the sheet tension constant.

Traverse function NEW

The traverse function, used for the traverse axis of spinning machine, prevents uneven winding or collapsing.

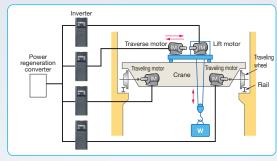

Torque accuracy

	Real sensorless vector control	Vector control
Torque control range	1:20	1:50
Absolute torque accuracy*1	±20%	±10%*3
Repetitive torque accuracy*2	±10%	±5%*3

- 1: Difference between the actual torque and the torque command
- *2: Fluctuation between the average of the actual torque and the actual measured torque (repeatability of the torque)
 *3: When online auto tuning (adaptive magnetic flux observer) enabled

Cranes

Relentless operation is possible with HD rating when lifting. And when traveling, vibrations applied to objects being conveyed are suppressed with anti-sway control, facilitating efficient operation.

Typical industries

Lumber, wood product manufacturing industries

Steel industry

Warehousing

Water transportation

Textile industry

Metal products manufacturing

High torque at low speed

[Starting torque]

- Real sensorless vector control 200% (ND rating)
- Vector control 200% (ND rating)

 (150% of initial setting for the 5.5K and higher)
- [Zero-speed torque]

 Vector control: 200% (Select HD rating.)

PLC function **NEW**

By employing synchronous operation for gate-type cranes, positional displacement of both axes is corrected during travel, achieving highly accurate control without using an external controller.

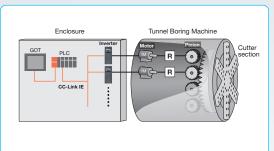

Anti-sway control NEW

When an object is moved by a crane, swinging at the time of stopping is suppressed on the crane's transverse axis or traveling axis.

This control cuts down the tact time and facilitates efficient operation.

Tunnel Boring Machines

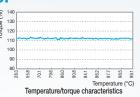

Inverters can be used to provide high starting torque for digging, and for transferring earth and sand after digging. A lineup of products compatible with the IP55 protective structure is available as a separate series.

Typical industries

Construction industry

Real sensorless vector control

Motors are controlled without encoders, which are susceptible to hazardous environment. Use of such motors naturally provides higher reliability. Torque accuracy has also improved because the temperature is better controlled.

Droop control

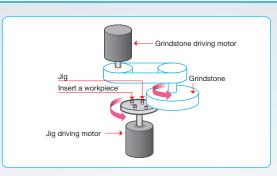

This function balances the load between motors when using multiple inverters.

CC-Link IE communication

CC-Link IE communication enables a programmable controller or a GOT to control multiple inverters. By using Ethernet cables, less wiring is required.

Machine Tools

The rotation speed can be set according to the material being processed. Stable high-speed rotation is also possible.

Typical industries

Metal products manufacturing

High-speed operation

[Operating frequency]

V/F control

590 Hz

■Vector control 400 Hz

■ Real sensorless vector control 400 Hz

Torque limit function

This is effective in preventing machine damage (tool damage prevention, etc.) due to sudden disturbance torque.

Orientation control (vector control)

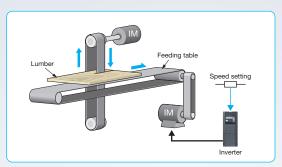

The inverter can adjust the stop position (Orientation control) using an encoder attached to a place such as the main shaft of the machine.

Application example

BEST SUITED FOR EVERY MACHINE

Wood Processing Machines

Even when processing areas of varying hardness such as lumber knots, processing time delays are suppressed by minimizing reductions in motor speed.

Typical industries

Lumber, wood product manufacturing industries

Forestry

Real sensorless vector control, vector control

Improved speed response to sudden load fluctuations when compared with the previous model (FR-A700).

[Response speed]

- Real sensorless vector control 50 Hz*1 (A700: 20 Hz)
- ■Vector control 130 Hz (A700: 50 Hz)

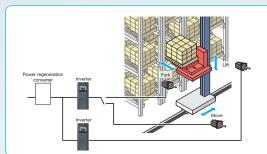

*1: At 3.7 kW with no load. Differs depending on the load conditions and motor capacity.

Torque limiting function

This function is effective in preventing machine damage (tool damage, etc.) due to sudden disturbance torque.

Conveyance

The new series offers a wealth of functionality suited to applications such as high-accuracy conveyance and target position stoppage, which contributes to reduction in tact time.

Typical industries

Steel industry

Metal products manufacturing

Lumber, wood product manufacturing industries

Water transportation, fishing industry

Textile industry

Warehousing

PM sensorless vector control

Multiple axes are strictly controlled to run at the same speed without using a driving belt. This control method provides driving accurate enough for transporting glass substrates without damaging them. Simple positioning control is also available.

(when high frequency superposition control selected in combination with MM-CF)

Increased magnetic excitation deceleration NEW

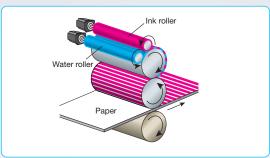

Deceleration time can be reduced without a brake resistor. Tact time can be eliminated at conveyor lines, etc.

PLC function **NEW**

When a few sensors are used to check the presence of goods on a conveyor and the arrival of such goods, the inverter can directly receive such signals from the sensors for the PLC control.

Printing Machines

The highly-accurate speed control minimizes color unevenness and displaced prints.

Typical industries

Printing and related industries

Speed control

	Real sensorless vector control	Vector control	PM sensorless vector control
Speed response	50 Hz*1	130 Hz	50 Hz
Speed control	1:200	1:1500	1:1000*3
	(when power drive	(both driving/	(when HD rating selected)
range	at 0.3 Hz to 60 Hz)	regeneration ²)	(when his falling selected)

- *1: At 3.7 kW with no load. Differs depending on the load conditions and motor capacity.
- *2: If using regeneration unit (option) during regeneration
- *3: When high frequency superposition control selected in combination with the MM-CF

PM sensorless vector control

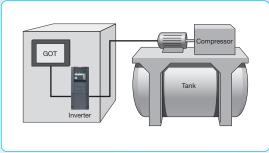

The speed fluctuations of the ink roller axis and water roller axis are minimized to eliminate print unevenness.

[Speed fluctuation ratio] ±0.05% (Digital input)

"No encoder" means less trouble and higher reliability.

Compressors

The PM sensorless vector control is useful in generating high starting torque. By using this control method with an IPM motor, much power can be saved. This small motor also makes the machine small.

Typical industries

Steel industry

Metal products manufacturing

Lumber, wood product manufacturing industries

Water transportation, fishing industry

Textile industry
Warehousing

PM sensorless vector control

Smooth operation is possible even at start-up under high load.

[Starting torque] 1.5 kW or lower: 200%, 2.0 kW or higher: 150%

When high frequency superposition control selected in combination with MM-CF

PID control

Pressure can be automatically adjusted by converting signals from the encoder to inverter input signals and feeding them back.

Parallel operation function **NEW**

Even a large compressor can be operated by FR-A842-P inverters with parallel operation function, which can operate a 630 kW or higher motor.

CONTRIBUTION TO FACTORY AUTOMATION

The PLC function will help you to provide the control sequence best suited for the machine specifications.

1 Inverter operation sequence customized for the machine

•A set of operations (operation at different signal inputs, signal and monitor outputs at different inverter status, etc.) can be freely programmed in accordance with the machine specifications. For example, a shutter opening/closing can be performed based on a signal from a sensor, or based on the opening/closing times.

Control programs can be created in sequence ladders using the inverter setup software (FR Configurator2).

2 Realizes the decentralized control

- •The control of the whole system is decentralized to inverters that mange their subordinating devices individually.
- •A group of dedicated sequence programs is created and saved in each inverter. The master controller no longer has to process all the sequence programs, and the decentralized system accepts program changes more flexibly.

3 Automatic operation in accordance with the time

 With the real-time clock, automatic operation can be performed at certain times (when the optional LCD operation panel (FR-LU08) is used).

4 Useful functions

User parameter

Up to 50 parameters, which are linked with the data registers, can be saved. The variables (data registers) used in the PLC function can be saved as inverter parameters. Furthermore, parameter settings can be saved in the EEPROM of inverter. When results of calculation using the PLC function are saved in the parameters, the data can be retained after the power is turned OFF.

User initiated fault

Inverter output can be shut off under conditions other than those of the existing protective functions. Up to five specific fault-initiating conditions can be set to activate a protective function and shut off the inverter output.

Monitored item for the user

Special register values can be displayed for monitoring on the operation panel. Arbitrary data designated by the user such as results of calculation using the PLC function can be displayed.

Inverter parameter read/write

Parameter settings can be changed using sequence programs. The acceleration/deceleration patterns can also be set with sequence programs to be changed at certain operation statuses. You can choose RAM or EEPROM to save the parameter settings. When the settings are changed frequently, choose RAM.

PID function

Two different loops of PID inverter operations can be pre-set, and those can be controlled using sequence programs.

Inverter operation lock

The inverter operation can be restricted for the command sources other than the sequence programs.

PLC function

LO Idilotto	
Item	Description
I/O	
General-purpose I/O	Sequence programs enable I/O signal transmission to/from the inverter and its plug-in options.
A 1 1/0	Sequence programs enable reading of analog input values or analog output transmission by the inverter,
Analog I/O	and analog output transmission to the plug-in options.
Pulse train I/O	Sequence programs enable pulse train inputs (to terminal JOG) and pulse train outputs (from terminal F/C(FM)).
Inverter parameter read/write	Sequence programs enable inverter parameter write/read.
	Fifty user parameters (Pr.1150 to Pr.1199) are available and are linked with the data registers D206 to D255,
User parameter	which accept direct access by sequence programs.
CC-Link	A plug-in option (FR-A8NC) enables handling of remote registers as arbitrary data in the sequence programs.
Special function	
PID operation	Inverter's PID operations can be set (up to two loops).
User initiated fault	Up to five fault-initiating conditions can be set to activate a protective function.
Fault clear	The protective function occurring in the inverter can be reset.
Inverter operation lock	Inverters can start up while the PLC function is running.
Monitored item for the user	Desired data is displayable on the operation panel.

Application example

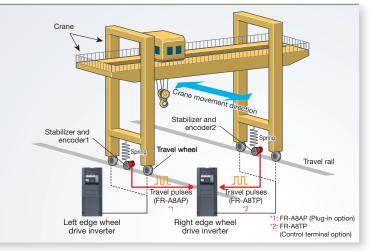

Crane control

The traveled distance (total number of travel pulses) of each wheel is directly read from the encoder installed at the wheel. The pulses from the two wheels are then compared, and their speed is adjusted to synchronize the wheel positions. There is no need to use an external controller to offset speed, allowing high accuracy control.

User initiated fault

Up to five protective functions operating under specific conditions can be set. Protective functions can be triggered to block inverter output at such times as when positional displacements are not eliminated even after offsetting speed over a fixed period of time, or pulses from the PLGs on both wheels are not input.

Conveyor control

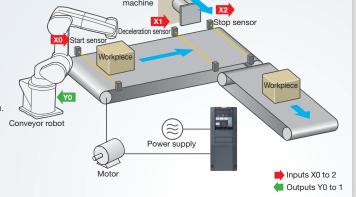

The workpiece positions detected by sensors are directly reported to the inverter, and the inverter sends out the operation commands to the conveyor robot and to the extruding machine. Whole control can be performed by an inverter, in accordance with the movement of its peripheral equipment.

Inverter parameter read/write

Changes can be made to inverter parameters from the sequence program. The acceleration/deceleration time and pattern can be set based on the type of workpiece.

Inverter operation lock

Operation is possible only when the sequence function is enabled. Changes to settings caused by operator error can be avoided.

Extruding

Fan control

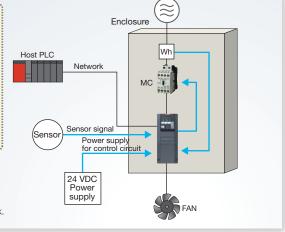

Signals sent via the enclosure (relay panel, etc.) such as input magnetic contactor signals, watt hour meter signals, and sensor signals can be read directly into the inverter and controlled. A fan can be controlled in accordance with the conditions without using relays, etc. Furthermore, by using an external 24 VDC power source for the control power supply, input machine signals can be turned ON and OFF regardless of whether there is an input power source. And by employing an external 24 VDC power supply for the control power, input machine signals can be turned ON and OFF, regardless of the existence of a main circuit power supply.

CC-Link

A plug-in option (FR-A8NC) enables handling of remote registers as arbitrary data in the sequence programs.

A variety of equipment inside the factory can be centrally controlled with a CC-Link Network.

DELIVERING A COMFORTABLE INVERTER OP

From inverter startup to maintenance, this versatile software allows the user to specify settings easily at the computer.

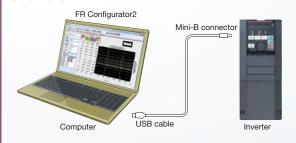

[Compatible operating systems]

Windows® 10, Windows® 8.1/Pro/Enterprise, Windows® 8, Windows® 7, (32-bit, 64-bit), Windows Vista® (32-bit)

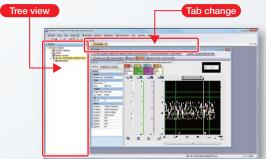

Easy connection with a USB cable

A USB connector (Mini-B connector) is provided as standard. Easy connection to the computer without the need for a converter.

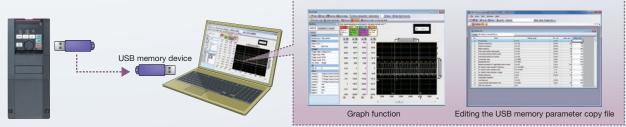

Intuitive user interface

Connected inverters are displayed in tree view format. Windows for each function can be accessed by changing the tab for maximum efficiency.

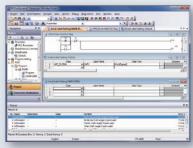

Work can be carried out away from the equipment using a USB memory device

By loading trace data and parameter settings copied to a USB memory device into FR Configurator2, analysis and adjustments can be carried out with ease away from the equipment.

Sequence control (Developer function)

The Developer function is used for creating sequence programs and writing them to the inverter to enable the use of the PLC function of the inverter.

Free trial version Supported

The function with the marking above is available in the free trial version (usable free of charge with limited functions). It can be downloaded at Mitsubishi Electric FA Global Website.

USB memory parameter copy file edit

Parameter settings (USB memory device parameter copy file) read from the inverter to a USB memory device can be edited. With the iQSS backup file conversion function, the files in the backup/restore format generated by the GOT can be converted and edited.

Help

Easy-to-follow platform facilitates easy maintenance

Free trial version Supp

Diagnosis (fault history)

Inverter fault history can be read and displayed together with the alarm occurrence time.

Activating faults can be displayed, and inverters can also be reset.

Displays the content of inverter and

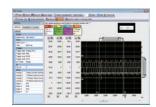

software Instruction Manuals.

Free trial version Supported

Graph function

Inverter data can be sampled and displayed in a graphical format. Trace data can also be read and displayed in a graph.

Life diagnosis

Free trial version Supported

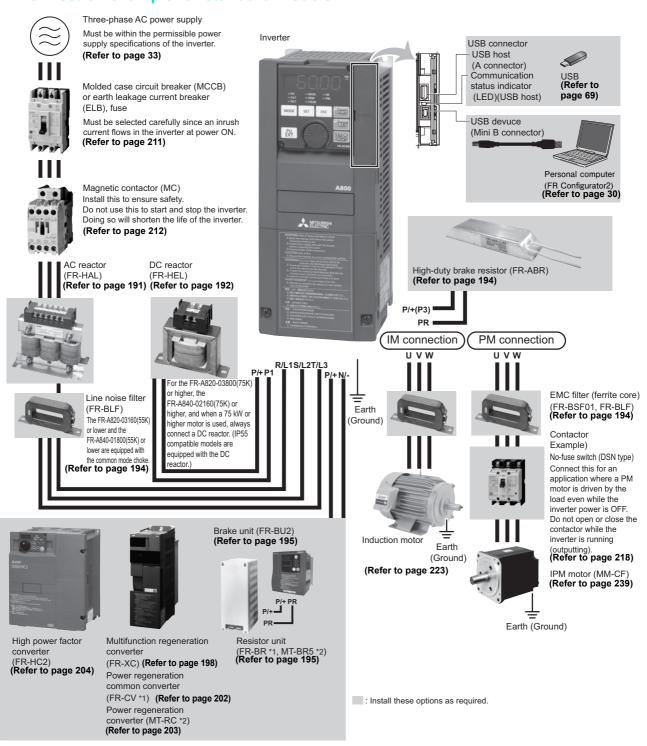

Life information read from the inverter is displayed.

Check marks appear in the life alarm fields of inverter parts that have exceeded their replacement schedule.

Diagnosis results can also be output to a file.

Connection Example

Connection example for standard models

- *1 Compatible with the FR-A820-03160(55K) or lower / FR-A840-01800(55K) or lower.
- *2 Compatible with the FR-A820-03800(75K) or higher / FR-A840-02160(75K) or higher.

- The applicable motor capacity indicated is the maximum capacity applicable for use of the Mitsubishi Electric 4-pole standard motor.
- The 0.2 kW motor capacity is applicable under V/F control only.
- The rated output capacity indicated assumes that the output voltage is 220 V for 200 V class.
- The % value of the overload current rating indicated is the ratio of the overload current to the inverter's rated output current. For repeated duty, allow time for the inverter and motor to return to or below the temperatures under 100% load.
- The maximum output voltage does not exceed the power supply voltage. The maximum output voltage can be changed within the setting range. However, the maximum point of the voltage waveform at the inverter output side is the power supply voltage multiplied by about $\sqrt{2}$.
- Value for the built-in brake resistor
- The rated input current indicates a value at a rated output voltage. The impedance at the power supply side (including those of the input reactor and cables) affects the
- The power supply capacity is the value when at the rated output current. It varies by the impedance at the power supply side (including those of the input reactor and

- The applicable motor capacity indicated is the maximum capacity applicable for use of the Mitsubishi Electric 4-pole standard motor.
- The rated output capacity indicated assumes that the output voltage is 440 V.
- The % value of the overload current rating indicated is the ratio of the overload current to the inverter's rated output current. For repeated duty, allow time for the inverter and motor to return to or below the temperatures under 100% load. *3
- The maximum output voltage does not exceed the power supply voltage. The maximum output voltage can be changed within the setting range. However, the maximum point of the voltage waveform at the inverter output side is the power supply voltage multiplied by about $\sqrt{2}$.

- FR-DU08: IP40 (except for the PU connector section)
 For the power voltage exceeding 480 V, set **Pr.977 Input voltage mode selection**.

• Operation panel (FR-DU08, FR-LU08)

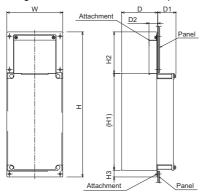

Protruding the heat sink through the panel

When encasing the inverter or the converter unit in an enclosure, the heat generated in the enclosure can be greatly reduced by protruding the heat sink of the inverter or the converter unit. When installing the inverter in a compact enclosure, etc., this installation method is recommended. For the FR-A840-04320(160K) or higher, a heat sink can be protruded outside the enclosure without using an attachment.

♦ When using a panel through attachment (FR-A8CN)

For the FR-A820-00105(1.5K) to FR-A820-04750(90K) and FR-A840-00023(0.4K) to FR-A840-03610(132K), a heat sink can be protruded outside the enclosure using a panel through attachment (FR-A8CN). Refer to the Instruction Manual of the panel through attachment (FR-A8CN) for details.

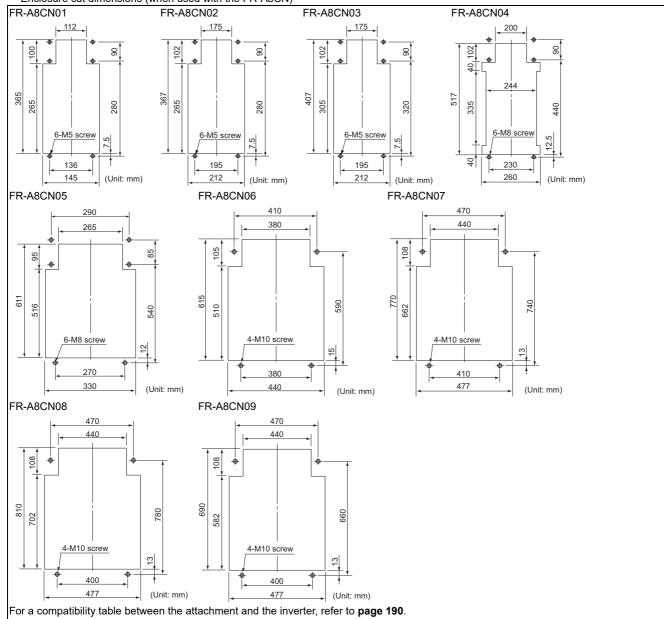

• Drawing after attachment installation (when used with the FR-A8CN)

Type	W	Н	H1	H2	Н3	D	D1	D2

(Unit: mm)

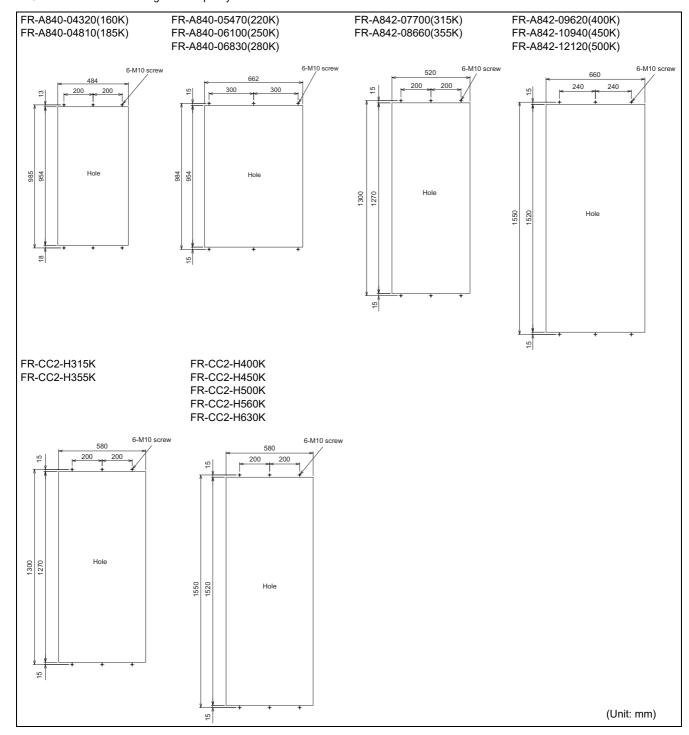

· Enclosure cut dimensions (when used with the FR-A8CN)

♦ Heat sink protrusion through the panel for the FR-A840-04320(160K) or higher

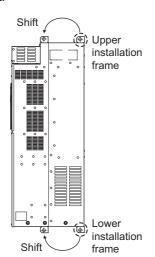

Enclosure cutting

Cut an enclosure according to the capacity of the inverter or the converter unit.

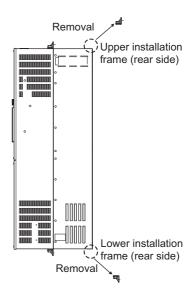

Shift and removal of a rear side installation frame
 For the FR-A840-04320(160K) to FR-A840-06830(280K)

One installation frame is attached to each of the upper and lower parts of the inverter. Change the position of the rear side installation frame on the upper and lower sides of the inverter to the front side as shown below. When changing the installation frames, make sure that the installation orientation is correct.

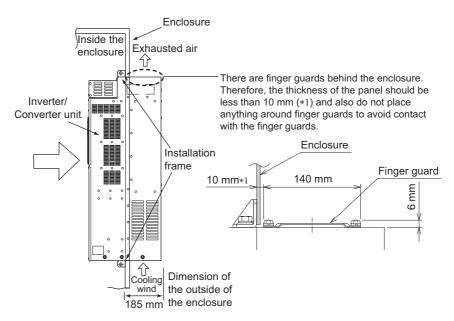

For the FR-A842-07700(315K) to FR-A842-12120(500K), FR-CC2-H315K to FR-CC2-H630K

Two installation frames are attached to each of the upper and lower parts of the inverter or the converter unit. Remove the rear side installation frame on the upper and lower sides of the inverter or the converter unit as shown below.

• Installation of the inverter or the converter unit

Push the inverter heat sink portion outside the enclosure and fix the enclosure and the inverter or the converter unit with upper and lower installation frame.

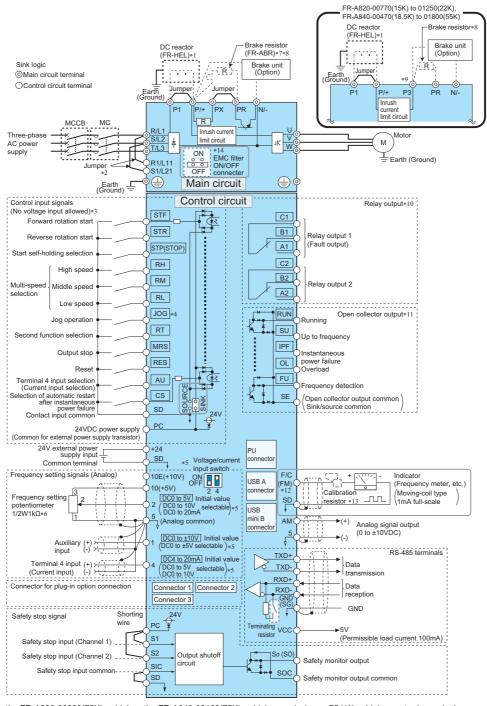

NOTE

- Having a cooling fan, the cooling section which comes out of the enclosure cannot be used in the environment of water drops, oil, mist, dust, etc.
- Be careful not to drop screws, dust etc. into the inverter or the converter unit and the cooling fan section.
- The FR-A7CN panel through attachment cannot be installed on the FR-A800 series.

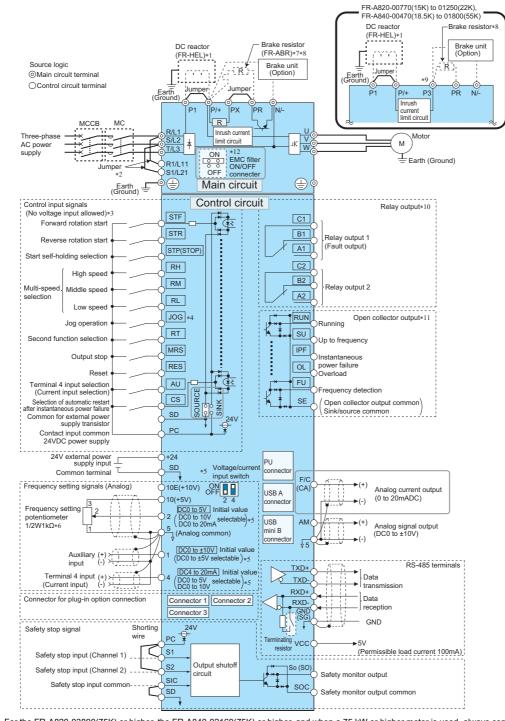

Terminal Connection Diagram

Standard models and IP55 compatible models

• FM type

- For the FR-A820-03800(75K) or higher, the FR-A840-02160(75K) or higher, and when a 75 kW or higher motor is used, always connect a DC reactor (FR-HEL), which is available as an option. (To select a DC reactor, refer to **page 33**, **page 223**, and select one according to the applicable motor capacity.) When connecting a DC reactor, if a jumper is installed across terminals P1 and P/+, remove the jumper before installing the DC reactor. The IP55 compatible model has a built-in DC reactor. (The jumper is not installed for the FR-A820-03800(75K) or higher and the FR-A840-02160(75K) or
- When using separate power supply for the control circuit, remove the jumper between R1/L11 and S1/L21. IP55 compatible models do not have terminals *2 R1/L11, S1/L21, and jumpers.
- The function of these terminals can be changed with the input terminal assignment (Pr.178 to Pr.189). (Refer to page 146.)
- Terminal JOG is also used as a pulse train input terminal. Use Pr.291 to choose JOG or pulse
- *5 Terminal input specifications can be changed by analog input specification switchover (Pr.73, Pr.267). To input a voltage, set the voltage/current input switch OFF. To input a current, set the voltage/current input switch ON. (Refer to page 132.)
- *6
- It is recommended to use 2 W 1 k Ω when the frequency setting signal is changed frequently. If connecting a brake resistor, remove the jumper between PR and PX (FR-A820-00046(0.4K) to 00490(7.5K), FR-A840-00023(0.4K) to 00250(7.5K)).
- *8 Connect a brake resistor across terminals P/+ (P3) and PR. (Terminal PR is equipped in FR-Á820-00046(0.4K) to 01250(22K), FR-Á840-00023(0.4K) to 01800(55K).) Install a thermal relay to prevent overheating and damage of discharging resistors
- Do not connect the DC power supply (under DC feeding mode) to terminal P3.
- The function of these terminals can be changed with the output terminal assignment (Pr.195, Pr.196). (Refer to page 147.)
- The function of these terminals can be changed with the output terminal assignment (Pr.190 to Pr.194). (Refer to page 147.) Terminal F/C (FM) can be used to output pulse trains as open collector output by setting Pr.291.
- Not required when calibrating the scale with the operation panel.
- Do not change the initially set ON (enabled) position of the EMC filter ON/OFF connector in the case of the inverter with a built-in C2 filter (IP55 compatible model). The Class C2 compatibility condition is not satisfied with the EMC filter OFF. The FR-A846-00250(7.5K)-C2 to FR-A846-00470(18.5K)-C2 are not provided with the EMC filter ON/OFF connector. The EMC filter is always ON.

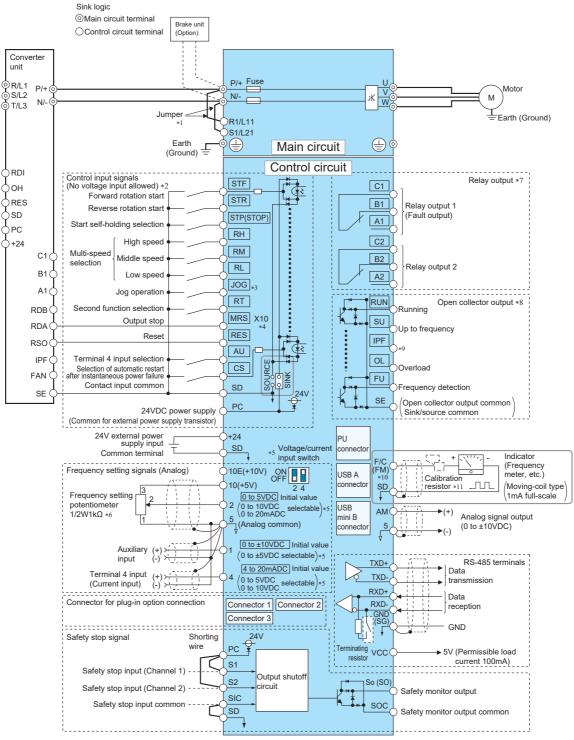

- For the FR-A820-03800(75K) or higher, the FR-A840-02160(75K) or higher, and when a 75 kW or higher motor is used, always connect a DC reactor (FR-HEL), which is available as an option. (To select a DC reactor, refer to page 33, page 223, and select one according to the applicable motor capacity.) When connecting a DC reactor, if a jumper is installed across terminals P1 and P/+, remove the jumper before installing the DC reactor. The IP55 compatible model has a built-in DC reactor. (The jumper is not installed for the FR-A820-03800(75K) or higher and the FR-A840-02160(75K) or higher.)
- When using separate power supply for the control circuit, remove the jumper between R1/L11 and S1/L21. IP55 compatible models do not have terminals R1/L11, S1/L21, and jumpers
- The function of these terminals can be changed with the input terminal assignment (Pr.178 to Pr.189). (Refer to page 146.)
- Terminal JOG is also used as a pulse train input terminal. Use Pr.291 to choose JOG or pulse
- Terminal input specifications can be changed by analog input specification switchover (Pr.73, Pr.267). To input a voltage, set the voltage/current input switch OFF. To input a current, set the voltage/current input switch ON. (Refer to page 132.) It is recommended to use $2 \text{ W } 1 \text{ k}\Omega$ when the frequency setting signal is changed frequently.

- If connecting a brake resistor, remove the jumper between PR and PX (FR-A820-00046(0.4K) to 00490(7.5K), FR-A840-00023(0.4K) to 00250(7.5K)). Connect a brake resistor across terminals P/+ (P3) and PR. (Terminal PR is equipped in FR-A820-00046(0.4K) to 01250(22K), FR-A840-00023(0.4K) to 01800(55K).) Install a thermal relay to prevent overheating and damage of discharging resistors. *8
- Do not connect the DC power supply (under DC feeding mode) to terminal P3.
- *10
- The function of these terminals can be changed with the output terminal assignment (Pr.195, Pr.196). (Refer to page 147.)
 The function of these terminals can be changed with the output terminal assignment (Pr.190 to Pr.194). (Refer to page 147.)
- Do not change the initially set ON (enabled) position of the EMC filter ON/OFF connector in the case of the inverter with a built-in C2 filter (IP55 compatible model). The Class C2 compatibility condition is not satisfied with the EMC filter OFF. The FR-A846-00250(7.5K)-C2 to FR-A846-00470(18.5K)-C2 are not provided with the EMC filter ON/OFF connector. The EMC filter is always ON.

Separated converter type

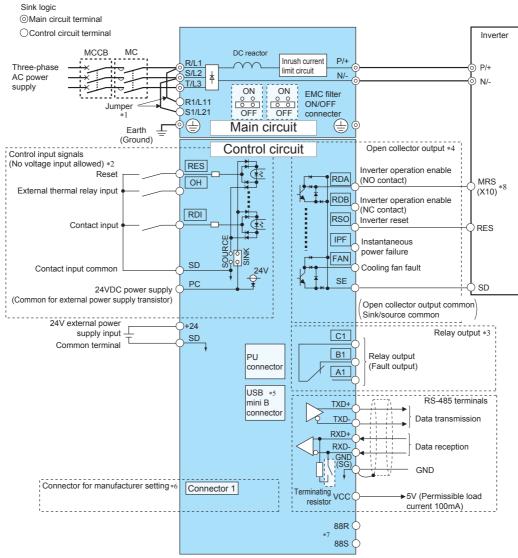

• FM type

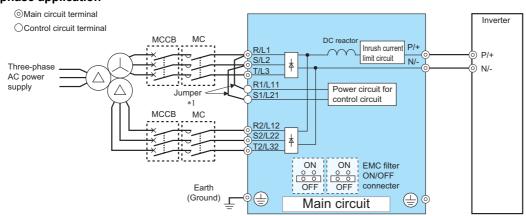

- Terminals R1/L11 and S1/L21 are connected to terminals P/+ and N/- with a jumper respectively. When using separate power supply for the control circuit, *1 remove the jumpers from R1/L11 and S1/L21.
- The function of these terminals can be changed with the input terminal assignment (**Pr.178 to Pr.189**). Terminal JOG is also used as the pulse train input terminal. Use **Pr.291** to choose JOG or pulse. *2
- *3
- The X10 signal (NC contact input specification) is assigned to terminal MRS in the initial setting. Set Pr.599 = "0" to change the input specification of the X10 signal to NO contact.
- Terminal input specifications can be changed by analog input specification switchover (Pr.73, Pr.267). To input a voltage, set the voltage/current input *5 switch OFF. To input a current, set the voltage/current input switch ON. Terminals 10 and 2 are also used as a PTC input terminal. (Pr.561)
- *6 It is recommended to use 2 W 1 $k\Omega$ when the frequency setting signal is changed frequently. The function of these terminals can be changed with the output terminal assignment (Pr.195, Pr.196).
- The function of these terminals can be changed with the output terminal assignment (Pr.190 to Pr.194).
- *9 No function is assigned in the initial setting. Use Pr.192 for function assignment.
- Terminal FM can be used to output pulse trains as open collector output by setting Pr.291.
- Not required when calibrating the scale with the operation panel.

Converter unit (FR-CC2)

• When the sink logic is selected

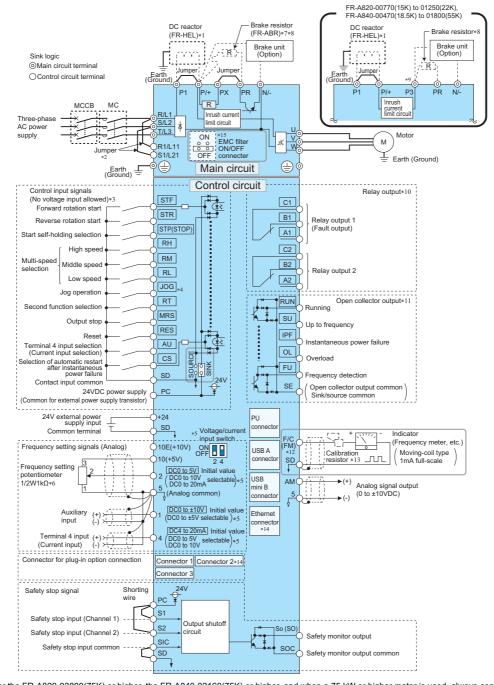

◆ For a 12-phase application

- When using separate power supply for the control circuit, remove the jumpers from R1/L11 and S1/L21.
- The function of these terminals can be changed with the input terminal assignment (Pr.178, Pr.187, Pr.189).
- The function of these terminals can be changed with the output terminal assignment (Pr.195). The function of these terminals can be changed with the output terminal assignment (Pr.190 to Pr.194).
- The connector is for manufacturer setting. Do not use.
- Plug-in options cannot be used.
- For manufacturer setting. Do not use.
- To use RDA signal of the converter unit, select the NC contact input specification for the input logic of MRS signal or X10 signal of the inverter. To use RDB signal of the converter unit, select the NO contact input specification for the input logic of MRS signal or X10 signal of the inverter. (For changing the input logic, refer to the Instruction Manual of the inverter.)

FR-A800-E

• FM type

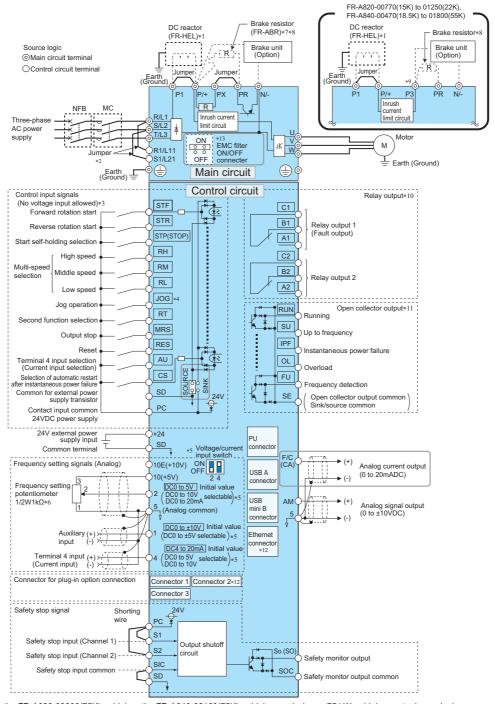

- For the FR-A820-03800(75K) or higher, the FR-A840-02160(75K) or higher, and when a 75 kW or higher motor is used, always connect a DC reactor (FR-HEL), which is available as an option. (To select a DC reactor, refer to page 33, page 223, and select one according to the applicable motor capacity.) When connecting a DC reactor, if a jumper is installed across terminals P1 and P/+, remove the jumper before installing the DC reactor. The IP55 compatible model has a built-in DC reactor. (The jumper is not installed for the FR-A820-03800(75K) or higher and the FR-A840-02160(75K) or higher.)
- *2 When using separate power supply for the control circuit, remove the jumper between R1/L11 and S1/L21. IP55 compatible models do not have terminals R1/L11, S1/L21, and jumpers.
- The function of these terminals can be changed with the input terminal assignment (Pr.178 to Pr.189). (Refer to page 146.) *3
- *4
- Terminal JOG is also used as a pulse train input terminal. Use **Pr.291** to choose JOG or pulse.

 Terminal input specifications can be changed by analog input specification switchover (**Pr.73, Pr.267**). To input a voltage, set the voltage/current input *5 switch OFF. To input a current, set the voltage/current input switch ON. (Refer to page 132.)
- *6
- It is recommended to use 2 W 1 kΩ when the frequency setting signal is changed frequently.

 If connecting a brake resistor, remove the jumper between PR and PX (FR-A820-00046(0.4K) to 00490(7.5K), FR-A840-00023(0.4K) to 00250(7.5K)).
- Connect a brake resistor across terminals P/+ (P3) and PR. (Terminal PR is equipped in FR-A820-00046(0.4K) to 01250(22K), FR-A840-00023(0.4K) to *8 01800(55K).) Install a thermal relay to prevent overheating and damage of discharging resistors.
- *9 Do not connect the DC power supply (under DC feeding mode) to terminal P3.
- The function of these terminals can be changed with the output terminal assignment (Pr.195, Pr.196). (Refer to page 147.)
- The function of these terminals can be changed with the output terminal assignment (Pr.190 to Pr.194). (Refer to page 147.) *11
- *12 Terminal F/C (FM) can be used to output pulse trains as open collector output by setting Pr.291.
- Not required when calibrating the scale with the operation panel.
- The option connector 2 cannot be used because the Ethernet board is installed in the initial status. The Ethernet board must be removed to install a plug-in option to the option connector 2. (However, Ethernet communication is disabled in that case.)
- Do not change the initially set ON (enabled) position of the EMC filter ON/OFF connector in the case of the inverter with a built-in C2 filter (IP55 compatible model). The Class C2 compatibility condition is not satisfied with the EMC filter OFF. The FR-A846-00250(7.5K)-C2 to FR-A846-00470(18.5K)-C2 are not provided with the EMC filter ON/OFF connector. The EMC filter is always ON.

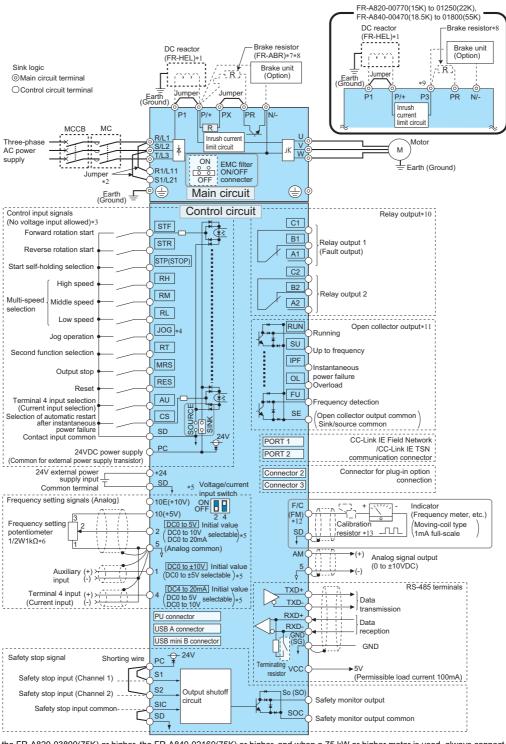

• CA type

- *1 For the FR-A820-03800(75K) or higher, the FR-A840-02160(75K) or higher, and when a 75 kW or higher motor is used, always connect a DC reactor (FR-HEL), which is available as an option. (To select a DC reactor, refer to **page 33**, **page 223**, and select one according to the applicable motor capacity.) When connecting a DC reactor, if a jumper is installed across terminals P1 and P/+, remove the jumper before installing the DC reactor. The IP55 compatible model has a built-in DC reactor. (The jumper is not installed for the FR-A820-03800(75K) or higher and the FR-A840-02160(75K) or higher.)
- *2 When using separate power supply for the control circuit, remove the jumper between R1/L11 and S1/L21. IP55 compatible models do not have terminals R1/L11, S1/L21, and jumpers.
- *3 The function of these terminals can be changed with the input terminal assignment (Pr.178 to Pr.189). (Refer to page 146.)
 *4 Terminal JOG is also used as a pulse train input terminal. Use Pr.291 to choose JOG or pulse.
- *5 Terminal input specifications can be changed by analog input specification switchover (Pr.73, Pr.267). To input a voltage, set the voltage/current input switch OFF. To input a current, set the voltage/current input switch ON. (Refer to page 132.)
- *6 It is recommended to use 2 W 1 k Ω when the frequency setting signal is changed frequently
- *7 If connecting a brake resistor, remove the jumper between PR and PX (FR-A820-00046(0.4K) to 00490(7.5K), FR-A840-00023(0.4K) to 00250(7.5K)).
- *8 Connect a brake resistor across terminals P/+ (P3) and PR. (Terminal PR is equipped in FR-A820-00046(0.4K) to 01250(22K), FR-A840-00023(0.4K) to 01800(55K).) Install a thermal relay to prevent overheating and damage of discharging resistors. (Refer to the Instruction Manual (Detailed).)
- Do not connect the DC power supply (under DC feeding mode) to terminal P3.
- *10 The function of these terminals can be changed with the output terminal assignment (Pr.195, Pr.196). (Refer to page 147.)
- *11 The function of these terminals can be changed with the output terminal assignment (Pr.190 to Pr.194). (Refer to page 147.)
- *12 The option connector 2 cannot be used because the Ethernet board is installed in the initial status. The Ethernet board must be removed to install a plug-in option to the option connector 2. (However, Ethernet communication is disabled in that case.)
- *13 Do not change the initially set ON (enabled) position of the EMC filter ON/OFF connector in the case of the inverter with a built-in C2 filter (IP55 compatible model). The Class C2 compatibility condition is not satisfied with the EMC filter OFF. The FR-A846-00250(7.5K)-C2 to FR-A846-00470(18.5K)-C2 are not provided with the EMC filter ON/OFF connector. The EMC filter is always ON.

FR-A800-GF, FR-A800-GN

• FM type

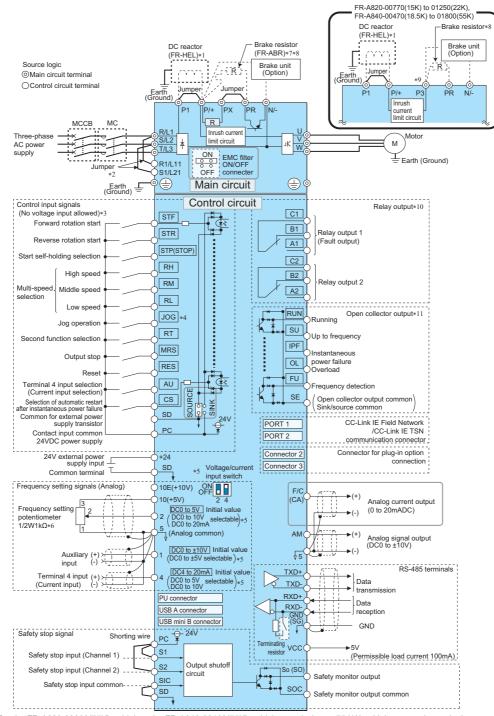

- For the FR-A820-03800(75K) or higher, the FR-A840-02160(75K) or higher, and when a 75 kW or higher motor is used, always connect a DC reactor (FR-HEL), which is available as an option. (To select a DC reactor, refer to page 33, page 223, and select one according to the applicable motor capacity.) When connecting a DC reactor, if a jumper is installed across terminals P1 and P/+, remove the jumper before installing the DC reactor. (The jumper is not installed for the FR-A820-03800(75K) or higher and the FR-A840-02160(75K) or higher.)
- *2
- When using separate power supply for the control circuit, remove the jumper between R1/L11 and S1/L21.

 The function of these terminals can be changed with the input terminal assignment (**Pr.178 to Pr.189**). (Refer to **page 146**.) *3
- Terminal JOG is also used as a pulse train input terminal. Use **Pr.291** to choose JOG or pulse.

 Terminal input specifications can be changed by analog input specification switchover (**Pr.73, Pr.267**). To input a voltage, set the voltage/current input switch OFF. To input a current, set the voltage/current input switch ON. (Refer to **page 132**.) *5
- It is recommended to use 2 W 1 $k\Omega$ when the frequency setting signal is changed frequently
- If connecting a brake resistor, remove the jumper between PR and PX (FR-A820-00046(0.4K) to 00490(7.5K), FR-A840-00023(0.4K) to 00250(7.5K)). Connect a brake resistor across terminals P/+ (P3) and PR. (Terminal PR is equipped in FR-A820-00046(0.4K) to 01250(22K), FR-A840-00023(0.4K) to *8
- 01800(55K).) Install a thermal relay to prevent overheating and damage of discharging resistors.
- *9
- Do not connect the DC power supply (under DC feeding mode) to terminal P3.

 The function of these terminals can be changed with the output terminal assignment (**Pr.195**, **Pr.196**). (Refer to **page 147**.) *10
- The function of these terminals can be changed with the output terminal assignment (Pr.190 to Pr.194). (Refer to page 147.)
- Terminal F/C (FM) can be used to output pulse trains as open collector output by setting Pr.291.
- Not required when calibrating the scale with the operation panel.

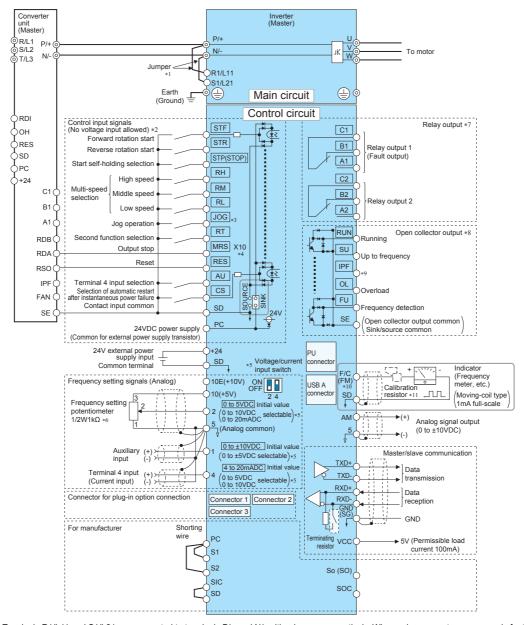

- For the FR-A820-03800(75K) or higher, the FR-A840-02160(75K) or higher, and when a 75 kW or higher motor is used, always connect a DC reactor (FR-HEL), which is available as an option. (To select a DC reactor, refer to **page 33**, **page 223**, and select one according to the applicable motor capacity.) When connecting a DC reactor, if a jumper is installed across terminals P1 and P/+, remove the jumper before installing the DC reactor. (The jumper is not installed for the FR-A820-03800(75K) or higher and the FR-A840-02160(75K) or higher.)
- When using separate power supply for the control circuit, remove the jumper between R1/L11 and S1/L21.
- The function of these terminals can be changed with the input terminal assignment (**Pr.178 to Pr.189**). (Refer to **page 146**.)
- Terminal JOG is also used as a pulse train input terminal. Use Pr.291 to choose JOG or pulse
- Terminal input specifications can be changed by analog input specification switchover (Pr.73, Pr.267). To input a voltage, set the voltage/current input switch OFF. To input a current, set the voltage/current input switch ON. (Refer to page 132.) *5
- It is recommended to use 2 W 1 $k\Omega$ when the frequency setting signal is changed frequently
- If connecting a brake resistor, remove the jumper between PR and PX (FR-A820-00046(0.4K) to 00490(7.5K), FR-A840-00023(0.4K) to 00250(7.5K)). Connect a brake resistor across terminals P/+ (P3) and PR. (Terminal PR is equipped in FR-A820-00046(0.4K) to 01250(22K), FR-A840-00023(0.4K) to
- *8 01800(55K).) Install a thermal relay to prevent overheating and damage of discharging resistors
- Do not connect the DC power supply (under DC feeding mode) to terminal P3.

 The function of these terminals can be changed with the output terminal assignment (**Pr.195**, **Pr.196**). (Refer to **page 147**.) *10
- The function of these terminals can be changed with the output terminal assignment (Pr.190 to Pr.194). (Refer to page 147.)

Separated converter type (FR-A842-P)

• FM type

Sink logic Main circuit terminal OControl circuit terminal

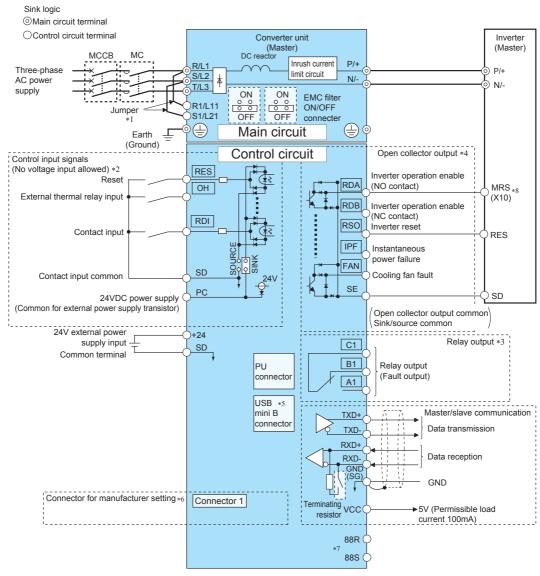

- Terminals R1/L11 and S1/L21 are connected to terminals P/+ and N/- with a jumper respectively. When using separate power supply for the control circuit, remove the jumpers from R1/L11 and S1/L21.
- The function of these terminals can be changed with the input terminal assignment (**Pr.178 to Pr.189**). *2
- Terminal JOG is also used as the pulse train input terminal. Use Pr.291 to choose JOG or pulse
- The X10 signal (NC contact input specification) is assigned to terminal MRS in the initial setting. Set Pr.599 = "0" to change the input specification of the *4 X10 signal to NO contact.
- Terminal input specifications can be changed by analog input specification switchover (Pr.73, Pr.267). To input a voltage (0 to 5 V/0 to 10 V), set the voltage/current input switch OFF. To input a current (4 to 20 mA), set the voltage/current input switch ON. Terminals 10 and 2 are also used as a PTC input terminal. (Pr.561)
- It is recommended to use 2 W 1 $k\Omega$ when the frequency setting signal is changed frequently
- The function of these terminals can be changed with the output terminal assignment (Pr.195, Pr.196)
- The function of these terminals can be changed with the output terminal assignment (Pr.190 to Pr.194). *8
- No function is assigned in the initial setting. Use **Pr.192** for function assignment.
- Terminal F/C (FM) can be used to output pulse trains as open collector output by setting **Pr.291**. Not required when calibrating the scale with the operation panel. *10

· For the system configuration for the parallel operation, refer to the FR-A802-P Instruction Manual (Hardware).

Converter unit (FR-CC2-P)

• When the sink logic is selected

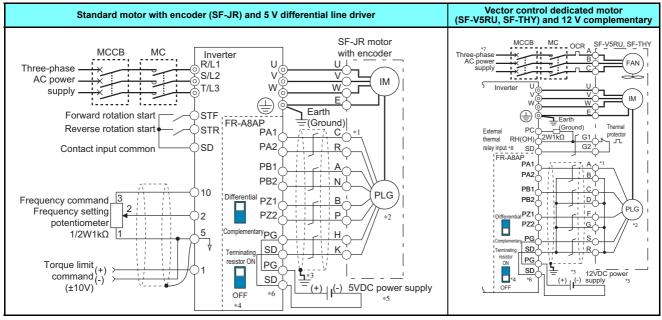

- When using separate power supply for the control circuit, remove the jumpers from R1/L11 and S1/L21.

- The function of these terminals can be changed with the input terminal assignment (Pr.178, Pr.187, Pr.189). The function of these terminals can be changed with the output terminal assignment (Pr.195). The function of these terminals can be changed with the output terminal assignment (Pr.190 to Pr.194).
- The connector is for manufacturer setting. Do not use.
- Plug-in options cannot be used.
- For manufacturer setting. Do not use.
- To use the RDA signal of the converter unit, select the NC contact input specification for the input logic of MRS signal or X10 signal of the inverter. To use the RDB signal of the converter unit, select the NO contact input specification for the input logic of MRS signal or X10 signal of the inverter. (For changing the input logic, refer to the Instruction Manual of the inverter.)

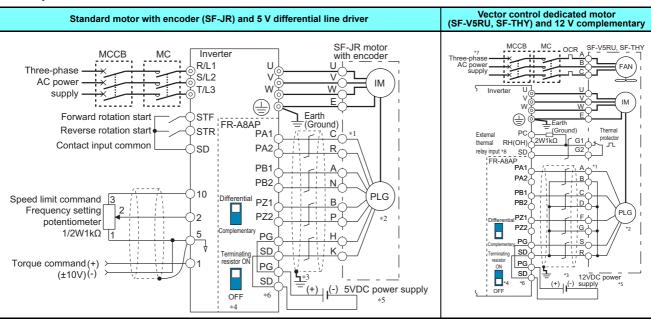

· For the system configuration for the parallel operation, refer to the FR-CC2-P Instruction Manual.

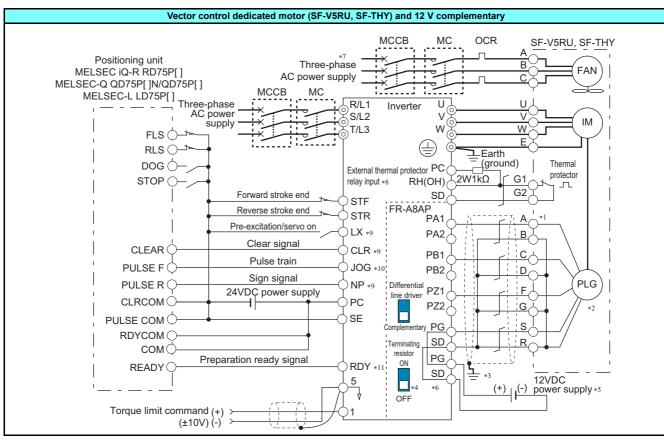

- Connection of motor with encoder (vector control) (when the sink logic is selected and the FR-A8AP is used)
- ♦ Speed control

◆ Torque control

Position control

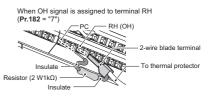

- The pin number differs according to the encoder used
 - Speed, control, torque control, and position control by pulse train input are available with or without the Z-phase being connected. Connect the encoder so that there is no looseness between the motor and motor shaft. Speed ratio must be 1:1.
- *2
- Earth (ground) the shield of the encoder cable to the enclosure using a tool such as a P-clip. (Refer to the Instruction Manual (Detailed).)
- For the complementary, set the terminating resistor selection switch to OFF position. (Refer to the Instruction Manual (Detailed).)
 A separate power supply of 5 V/12 V/15 V/24 V is necessary according to the encoder power specification. *4
- *5 When the encoder output is the differential line driver type, only 5 V can be input.
 - Make the voltage of the external power supply the same as the encoder output voltage, and connect the external power supply across PG and SD. For terminal compatibility of the FR-JCBL, FR-V7CBL, and FR-A8AP, refer to the Instruction Manual (Detailed).
- For the fan of the 7.5 kW or lower dedicated motor, the power supply is single phase. (200 V/50 Hz, 200 to 230 V/60 Hz)
 Connect the recommended 2W1kΩ resistor between terminals PC and OH. (Recommended
- product: MOS2C102J 2W1kΩ by KOA Corporation) Insert the input line and the resistor to a 2-wire blade terminal, and connect the blade terminal to

Insulate the lead wire of the resistor, for example by applying a contraction tube, and shape the wires so that the resistor and its lead wire will not touch other cables. Caulk the lead wire securely together with the thermal protector input line using a 2-wire blade terminal.

(Do not subject the lead wire's bottom area to an excessive pressure.)

To use a terminal as terminal OH, assign the OH (external thermal O/L relay input) signal to an input terminal. (Set "7" in any of Pr.178 to Pr.189. For details, refer to page 146.)

- Assign the function using Pr.178 to Pr.184, Pr.187 to Pr.189 (input terminal function selection).
- When position control is selected, terminal JOG function is invalid and simple position pulse train input terminal becomes valid. Assign the function using Pr.190 to Pr.194 (output terminal function selection).

Terminal Specification Explanation

Inverter

indicates that terminal functions can be selected from Pr.178 to Pr.196 (I/O terminal function selection). Terminal names and terminal functions are those of the factory set.

- Terminals R/L1, S/L2, T/L3, PR, P3, P1, and PX are not provided in the separated converter type.

 Terminals R/L1, S/L2, T/L3, PR, P3, and PX are not provided for the IP55 compatible model.

 Available for the FR-A820-00770(15K) to FR-A820-01250(22K), and the FR-A840-00470(18.5K) to FR-A840-01800(55K).

 The sink logic is initially set for the FM-type inverter.

 The source logic is initially set for the CA-type inverter.

 Terminal FM is provided in the FM-type inverter.

 Terminal CA is provided in the CA-type inverter.

 Function and name of the separated converter type.

 The terminals are for manufacturer setting for the FR-A842-P. Do not connect anything to these. Doing so may damage the inverter.

 Do not remove the shorting wires across the terminals S1 and PC, the terminals S2 and PC, and the terminals SIC and SD. Removing either shorting wire disables the inverter operation.

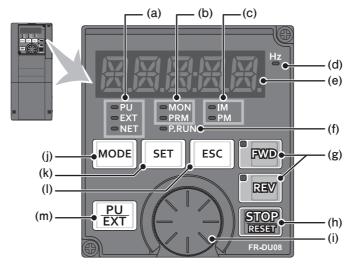

Converter unit (FR-CC2)

indicates that terminal functions can be selected from Pr.178, Pr.187, Pr.189 to Pr.195 (I/O terminal function selection). Terminal names and terminal functions are those of the factory set.

Operation Panel (FR-DU08(-01))

• Components of the operation panel

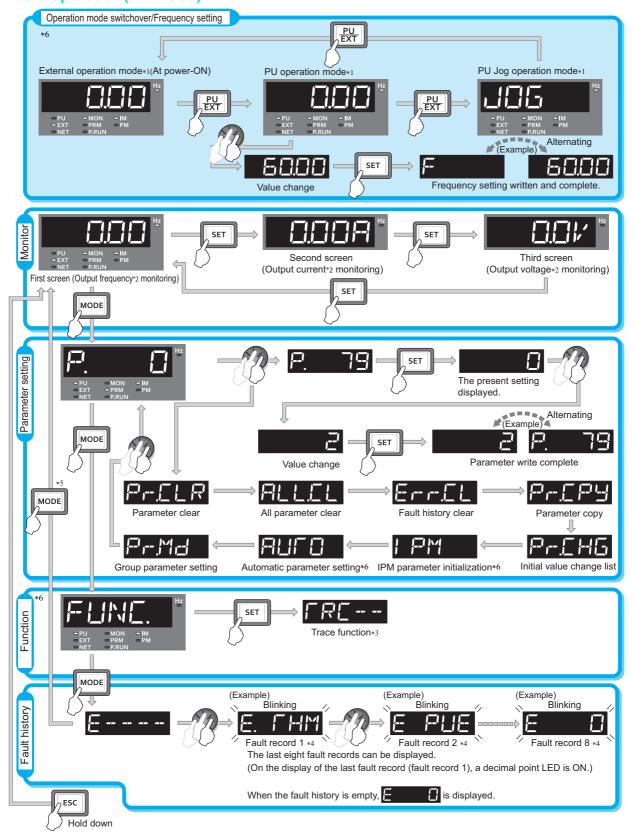

The operation panel of the inverter can be used for the converter unit.

No.	Compo	onent *1	Name	Description				
(a)	FR-DU08 PU EXT NET	FR-DU08-01 HAND AUTO NET	Operation mode indicator *2	PU/HAND: ON when the inverter is in the PU operation mode. EXT/AUTO: ON when the inverter is in the External operation mode. (ON when the inverter in the initial setting is powered ON.) NET: ON when the inverter is in the Network operation mode. PU and EXT: ON when the inverter is in the External/PU combined operation mode 1 or 2.				
(b)	→ MON → PRM		Operation panel status indicator	MON: ON when the operation panel is in the monitoring mode. Quickly blinks twice intermittently while the protective function is activated. PRM: ON when the operation panel is in the parameter setting mode.				
(c)	O IN		Control motor indicator *2	IM: ON when the inverter is set to control the induction motor. PM: ON to indicate the PM motor control. The indicator blinks during test operation.				
(d)	H	lz ⊃	Frequency unit indicator *2	ON when the actual frequency is monitored. (Blinks when the set frequency is monitored.)				
(e)			Monitor (5-digit LED)	Shows a numeric value (readout) of a monitor item such as the frequency or a parameter number. (The monitor item can be changed according to the settings of Pr.52, Pr.774 to Pr.776.)				
(f)	OP.	RUN	PLC function indicator *2	ON when the PLC function of the inverter is valid.				
(g)	FWD REV				FWD key, REV key *2	FWD key: Starts forward rotation operation. Its LED is ON during forward operation. REV key: Starts reverse rotation operation. Its LED is ON during reverse operation. Either LED blinks under the following conditions. • When the frequency command is not given even if the forward/reverse command is given. • When the frequency command is equal to the starting frequency or lower. • When the MRS signal is being input.		
(h)	SI	TOP	STOP/RESET key	Stops the operation commands. Used to reset the inverter when the protection function is activated.				
(i)			Setting dial	The setting dial of the Mitsubishi Electric inverters. Turn the setting dial to change the setting of frequency or parameter, etc. Press the setting dial to perform the following operations: • To display a set frequency in the monitoring mode (The monitor item shown on the display can be changed by using Pr.992.) • To display the present setting during calibration • To display a fault history number in the fault history mode				
(j)	MODE		MODE key	Switches the operation panel to a different mode. The easy setting of the inverter operation mode is enabled by pressing this key simultaneously with PU EXT. Every key on the operation panel becomes inoperable by holding this key for 2 seconds. The key inoperable function is invalid when Pr.161="0 (initial setting)". (Refer to the FR-A800 Instruction Manual (Detailed).)				
(k)	SET		SET key	Confirms each selection. When this key is pressed during inverter operation, the monitor item can be changed according to the settings of Pr.52, Pr.774 to Pr.776.)				
(I)	ESC		ESC key	Goes back to the previous display. Holding this key for a longer time changes the display back to the monitor mode.				
()	FR-DU08	FR-DU08-01	DIVENT.	Switches between the PU operation mode, the PUJOG operation mode, and the External operation mode.				
(m)	PU HAND AUTO		PU/EXT key *2	Switches to the easy setting mode by pressing simultaneously with MODE. Also cancels the PU stop warning.				

- *1 The FR-DU08-01 is an operation panel for IP55 compatible models.
- Not available for the converter unit.

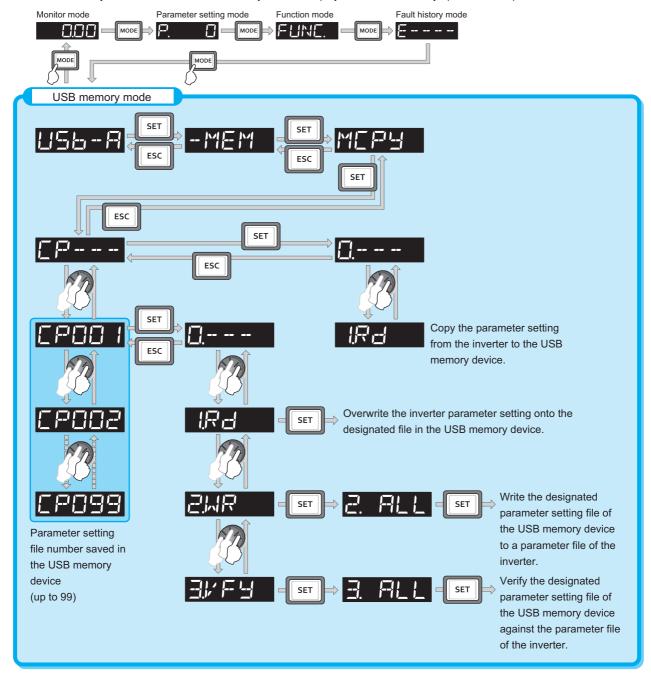

Basic operation(FR-DU08)

- For the details of operation modes, refer to page 134.
- The monitor items can be changed.(Refer to page 125.) For the details of the trace function, refer to page 174. *2 *3
- While a fault is displayed, the display shifts as follows by pressing SET : Output frequency at the fault → Output current → Output voltage → Energization *4 time \rightarrow Year \rightarrow Month \rightarrow Date \rightarrow Time. (After Time, it goes back to a fault display.) Pressing the setting dial shows the fault history number. The USB memory mode will appear if a USB memory device is connected. (Refer to **page 69**.)
- *6 Not available for the converter unit.

Parameter copy to the USB memory device

Insert the USB memory in the inverter. The USB memory mode is displayed and USB memory operations are possible.

• Group parameter display

Parameter numbers can be changed to grouped parameter numbers. Parameters are grouped by their functions. The related parameters can be set easily.

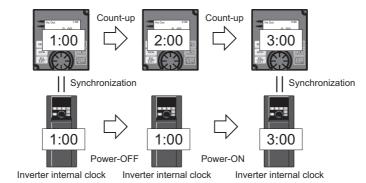

(1) Changing to the grouped parameter numbers

Pr.MD setting value	Description
0	No change
1	Parameter display by parameter number
2	Parameter display by function group

	Operation			
1.	Turning ON the power of the inverter			
••	The operation panel is in the monitor mode.			
2.	Selecting the parameter setting mode			
۷.	Press MODE to choose the parameter setting mode. (The parameter number read previously appears.)			
	Selecting the parameter			
3.	Turn until "-,-,',',-,' " (parameter display method) appears.			
	Press SET . " [" (initial value) will appear.			
	Selecting the use of the function group number			
4.	Turn ito change the set value to "," (group parameter display). Press SET to select the group parameter setting. ","			
	and "├──, ├── " are displayed alternately after the setting is completed.			
(2)	Changing parameter settings in the group parameter display			
_				
L	Changing example Change the P.H400(Pr.1) Maximum frequency.			
	Operation —			
Turning ON the power of the inverter The operation panel is in the monitor mode.				
	Changing the operation mode			
2.	Press PU to choose the PU operation mode. [PU] indicator is lit.			
	Selecting the parameter setting mode			
3.	Press MODE to choose the parameter setting mode. (The parameter number read previously appears.)			
	Enabling the function group selection			
	Press Esc several times until " appears.			
4.				
	(No need to press ESC if the previously read parameter is one of "			
	proceed to step 5)			
	Enabling the function group selection			
5.	Turn until "" (protective function parameter 4) appears. Press SET to display "" and make			
	the group parameters of the protective function parameter 4 selectable.			
	Selecting the parameter			
6.	Turn until " CP.H400 Maximum frequency) appears. Press SET to read the present set value.			
	" Company of the continuous lands appears.			
	Changing the setting value			
7.	Turn 😝 to change the set value to " 🖺 📗 🖟 ". Press SET to enter the setting. " 🖺 🔲 🖟 " and " 🗗 🖰 🛗 " are dis-			
	played alternately after the setting is completed.			

LCD operation panel (FR-LU08(-01))

- The FR-LU08 is an optional operation panel adopting an LCD panel capable of displaying text and menus.
- Replacement with the operation panel (FR-DU08) and installation on the enclosure surface using a connection cable (FR-CB2) are
 possible. (To connect the FR-LU08, an optional operation panel connection connector (FR-ADP) is required.)
- · Parameter settings for up to three inverters can be saved.
- When the FR-LU08 is connected to the inverter, the internal clock of the inverter can be synchronized with the clock of FRLU08. (Real time clock function)
 - With a battery (CR1216), the FR-LU08 time count continues even if the main power of the inverter is turned OFF. (The time count of the inverter internal clock does not continue when the inverter power is turned OFF.)
- The FR-LU08-01 meets the IP55 rating (except for the PU connector). It can be directly installed to the IP55 compatible model.

Appearance and parts name

	Symbol	Name	Description
	а	Power lamp	ON when the power is turned ON.
	b	Alarm lamp	ON when an inverter alarm occurs.
	С	Monitor	Shows the frequency, parameter number, etc. (Using Pr.52 , Pr.774 to Pr.776 , the monitored item can be changed.)
	d	FWD key, REV key	FWD key: Starts the forward operation. REV key: Starts the reverse operation.
(k	е	STOP/RESET key	Used to stop operation commands. Used to reset the inverter when the protective function is activated.
e)	f	Setting dial	The setting dial is used to change the frequency and parameter settings. Pressing the dial shows details of the fault history mode.
	g	PU/EXT key *1	Switches between the PU mode, the PUJOG mode, and the External operation mode.
	h	MON key	Shows the first monitored item.
	i	MENU key	Displays the quick menu. Pressing the key while the quick menu is displayed displays the function menu.
	j	Software key (F1)	
	k	Software key (F2)	Select a guidance displayed on the monitor.
	I	Software key (F3)	

^{*1} HAND/AUTO key for the FR-LU08-01.

Switching the main monitor data

When **Pr.52 Operation panel main monitor selection** is set to "0", by pressing (PREV) or (NEXT) of types of monitor data are displayed in order.

• Inverter parameter list (by parameter number)

For simple variable-speed operation of the inverter, the initial value of the parameters may be used as they are. Set the necessary parameters to meet the load and operational specifications. Parameter setting, change and check can be made from the operation panel (FR-DU08).

NOTE

Parameter List

- · Simple indicates simple mode parameters. Use Pr.160 User group read selection to indicate the simple mode parameters only.

 • Parameter setting may be restricted in some operating statuses. Use **Pr.77 Parameter write selection** to change the setting.

- The setting range or initial value for the FR-A820-03800(75K) or higher and FR-A840-02160(75K) or higher.
- The initial value for the FR-A820-00490(7.5K) or lower and FR-A840-00250(7.5K) or lower. The initial value for the FR-A820-00630(11K) or higher and FR-A840-00310(11K) or higher.
- Differ according to capacities.

 - 4%: FR-A820-00490(7.5K) or lower, FR-A840-00250(7.5K) or lower 2%: FR-A820-00630(11K) to FR-A820-03160(55K), FR-A840-0310(11K) to FR-A840-01800(55K) 1%: FR-A820-03800(75K) or higher, FR-A840-02160(75K) or higher
- The value for the 200 V class.
- The value for the 400 V class. *8
- The setting is available only when a vector control compatible option is installed. Refer to the Instruction Manual of each option for details.
- *10 The parameter number in parentheses is the one for use with the LCD operation panel and the parameter unit.
- The setting range or initial value for the standard model.
- The setting range or initial value for the separated converter type.
- The setting range or initial value for the IP55 compatible model The setting is available for the standard model only. *13
- *14
- The setting is available only for standard models and IP55 compatible models.
- The setting is available only for the FR-A800-GF or when a compatible plug-in option is installed.
- The setting range differs for the FR-A800-E. (Refer to **page 99**.) The setting is not available for the FR-A800-E. *17

- Parameter for manufacturer setting for the FR-A842-P. Do not set. The setting range differs for the FR-A842-P. (Refer to **page 99**.) *20
- *21 The setting is not available for the FR-A842-P.
- *22 The setting is available for the FR-A800-GN or FR-A800-GF, or when a compatible plug-in option is installed.
 *23 The setting is available when a compatible HMS network option is installed. For details, refer to the Instruction Manual (Detailed).

List of parameters for the FR-A800-E Ethernet communication (by parameter number)

The following table shows the extended parameters for the FR-A800-E as compared to the standard inverters. Set the parameters according to the application.

Function	Pr.	Pr. group	Name	Setting range	Minimum setting increments	Initial value	Refer to page	Customer setting

◆ F: Setting of acceleration/deceleration time and acceleration/deceleration pattern

Parameters that set the motor acceleration/deceleration characteristics.

Pr. group	Pr.	Name	Refer to page
F000	20	Acceleration/deceleration reference frequency	118
F001	21	Acceleration/deceleration time increments	118
F002	16	Jog acceleration/deceleration time	120
F003	611	Acceleration time at a restart	128
F010	7	Acceleration time Simple	118
F011	8	Deceleration time Simple	118
F020	44	Second acceleration/deceleration time	118
F021	45	Second deceleration time	118
F022	147	Acceleration/deceleration time switching frequency	118
F030	110	Third acceleration/deceleration time	118
F031	111	Third deceleration time	118
F040	1103	Deceleration time at emergency stop	174
F070	791 *7	Acceleration time in low-speed range	118
F071	792 *7	Deceleration time in low-speed range	118
F100	29	Acceleration/deceleration pattern selection	122
F101	59	Remote function selection	129
F102	13	Starting frequency	120
F103	571	Holding time at a start	120
F200	140	Backlash acceleration stopping frequency	122
F201	141	Backlash acceleration stopping time	122
F202	142	Backlash deceleration stopping frequency	122
F203	143	Backlash deceleration stopping time	122
F300	380	Acceleration S-pattern 1	122
F301	381	Deceleration S-pattern 1	122
F302	382	Acceleration S-pattern 2	122
F303	383	Deceleration S-pattern 2	122
F400	516	S-pattern time at a start of acceleration	122
F401	517	S-pattern time at a completion of acceleration	122
F402	518	S-pattern time at a start of deceleration	122
F403	519	S-pattern time at a completion of deceleration	122
F500	292	Automatic acceleration/deceleration	130
F510	61	Reference current	130
F511	62	Reference value at acceleration	130
F512	63	Reference value at deceleration	130
F513	293	Acceleration/deceleration separate selection	130
F520	64	Starting frequency for elevator mode	130

◆ D: Operation command and frequency command

Parameters that specify the inverter's command source, and parameters that set the motor driving frequency and torque.

Pr. group	Pr.	Name	Refer to page
D000	79	Operation mode selection Simple	134
D001	340	Communication startup mode selection	134
D010	338	Communication operation command source	155
D011	339	Communication speed command source	155
D012	550 *7	NET mode operation command source selection	155
D013	551	PU mode operation command source selection	155
D020	78	Reverse rotation prevention selection	134
D030	811	Set resolution switchover	122, 124
D100	291	Pulse train I/O selection	154
D101	384	Input pulse division scaling factor	154
D110	385	Frequency for zero input pulse	154
D111	386	Frequency for maximum input pulse	154
D120	432 *1	Pulse train torque command bias	166
D121	433 *1	Pulse train torque command gain	166
D200	15	Jog frequency	120
D300	28	Multi-speed input compensation selection	118
D301	4	Multi-speed setting (high speed) Simple	118
D302	5	Multi-speed setting (middle speed) Simple	118
D303	6	Multi-speed setting (low speed) Simple	118
D304 to D307	24 to 27	Multi-speed setting (4 speed to 7 speed)	118
D308 to D315	232 to 239	Multi-speed setting (8 speed to 15 speed)	118
D400	804	Torque command source selection	122, 166
D401	805	Torque command value (RAM)	122, 166
D402	806	Torque command value (RAM, EEPROM)	122, 166
D403	1114	Torque command reverse selection	166

♦ H: Protective function parameter

Parameters to protect the motor and the inverter.

Pr. group	Pr.	Name	Refer to page
H000	9	Electronic thermal O/L relay Simple	119
H001	600	First free thermal reduction frequency 1	119
H002	601	First free thermal reduction ratio 1	119
H003	602	First free thermal reduction frequency 2	119
H004	603	First free thermal reduction ratio 2	119
H005	604	First free thermal reduction frequency 3	119
H006	607	Motor permissible load level	119
H010	51	Second electronic thermal O/L relay	119
H011	692	Second free thermal reduction frequency 1	119
H012	693	Second free thermal reduction ratio 1	119
H013	694	Second free thermal reduction frequency 2	119
H014	695	Second free thermal reduction ratio 2	119
H015	696	Second free thermal reduction frequency 3	119

Pr. group	Pr.	Name	Refer to page
H016	608	Second motor permissible load level	119
H020	561	PTC thermistor protection level	119
H021	1016	PTC thermistor protection detection time	119
H022	876 *1	Thermal protector input	119
H030	875	Fault definition	169
H100	244	Cooling fan operation selection	148
H101	249	Earth (ground) fault detection at start	148
H102	598	Undervoltage level	162
H103	997	Fault initiation	172
H200	251	Output phase loss protection selection	149
H201	872 *4	Input phase loss protection selection	149
H300	65 *7	Retry selection	130
H301	67 *7	Number of retries at fault occurrence	130
H302	68 *7	Retry waiting time	130
H303	69 *7	Retry count display erase	130
H400	1	Maximum frequency Simple	117
H401	2	Minimum frequency Simple	117
H402	18	High speed maximum frequency	117
H410	807	Speed limit selection	166
H411	808	Forward rotation speed limit/speed limit	166
H412	809	Reverse rotation speed limit/reverse- side speed limit	166
H414	1113	Speed limit method selection	166
H415	873 *1	Speed limit	153
H416	285	Speed deviation excess detection frequency	152, 153
H417	853 *1	Speed deviation time	153
H420	31	Frequency jump 1A	124
H421	32	Frequency jump 1B	124
H422	33	Frequency jump 2A	124
H423	34	Frequency jump 2B	124
H424	35	Frequency jump 3A	124
H425	36	Frequency jump 3B	124
H429	552	Frequency jump range	124
H500	22	Stall prevention operation level (Torque limit level)	121
H501	156	Stall prevention operation selection	121
H520	1480 *8	Load characteristics measurement mode	176
H521	1481	Load characteristics load reference 1	176

Parameter for manufacturer setting for the FR-CC2-P. Do not set. The parameter is available for the FR-CC2-P only.

^{*1} *2

Explanations of Parameters

The following marks are used to show the applicable control method: The for V/F control, Magnetic flux for Advanced magnetic flux vector control, Sensorless for Real sensorless vector control, Vector for vector control, and PM for PM sensorless vector control. (Parameters without any mark are valid for all controls.)

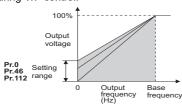

Pr.....denotes parameter numbers, and ROUP.....denotes group parameter numbers.

Connection diagrams appear with the control logic of the input terminals as sink logic, unless otherwise specified.

Manual torque boost Pr. GROUP Name Dr. GROUP Name O G000 Torque boost 112 G020 Third torque boost

Voltage drop in the low-frequency range can be compensated, improving reduction of the motor torque in the low-speed range.

- Motor torque in the low-frequency range can be adjusted according to the load, in order to increase the motor torque at start.
- The RT and X9 signals enable the switching between 3 types of torque boost.
- Available during V/F control.

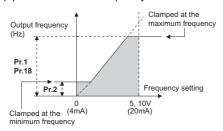

Limiting the output frequency (maximum/minimum frequency)

Pr.	GROUP	Name	Pr.	GROUP	Name
1	H400	Maximum frequency	2	H401	Minimum frequency
18	H402	High speed maximum frequency			

Motor speed can be limited.

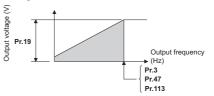

- · Clamp the upper and lower limits of the output frequency.
- To operate at a frequency higher than 120 Hz, adjust the maximum output frequency with Pr.18.
 (If a frequency is set in Pr.18, the Pr.1 setting automatically changes to the frequency set in Pr.18. Also, if a frequency is set in Pr.1, the Pr.18 setting automatically changes to the frequency set in Pr.1.)
- During position control under vector control, the maximum frequency is valid for the speed command calculated considering the droop pulses. The lower frequency limit is disabled.

Base frequency, voltage _____ Pr. GROUP GROUP Name Name Base frequency 3 G001 Base frequency 19 G002 voltage Second V/F (base Third V/F (base 47 G011 113 G021 frequency) frequency)

Use this function to adjust the inverter outputs (voltage, frequency) to match with the motor rating.

- When operating a standard motor, generally set the rated frequency of the motor in Pr.3 Base frequency. When running the motor using commercial power supply-inverter switch-over operation, set Pr.3 to the same value as the power supply frequency.
- When you want to change the base frequency when switching multiple motors with one inverter, etc., use the Pr.47 Second V/F (base frequency) and Pr.113 Third V/F (base frequency).
- Set the rated voltage (rated motor voltage, etc.) to the Pr.19 Base frequency voltage.
- Available during V/F control.

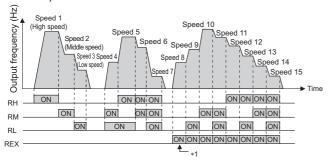

Multi-speed setting operation

Pr.	GROUP	Name	Pr.	GROUP	Name
4	D301	Multi-speed setting (high speed)	5	D302	Multi-speed setting (middle speed)
6	D303	Multi-speed setting (low speed)	24	D304	Multi-speed setting (speed 4)
25	D305	Multi-speed setting (speed 5)	26	D306	Multi-speed setting (speed 6)
27	D307	Multi-speed setting (speed 7)	28	D300	Multi-speed input compensation selection
232	D308	Multi-speed setting (speed 8)	233	D309	Multi-speed setting (speed 9)
234	D310	Multi-speed setting (speed 10)	235	D311	Multi-speed setting (speed 11)
236	D312	Multi-speed setting (speed 12)	237	D313	Multi-speed setting (speed 13)
238	D314	Multi-speed setting (speed 14)	239	D315	Multi-speed setting (speed 15)

Use these parameters to change among pre-set operation speeds with contact signals. The speeds are pre-set with parameters. Any speed can be selected by simply turning ON/OFF the contact signals (RH, RM, RL, and REX signals).

- The inverter operates at the frequency set in Pr.4 when RH signal is ON, Pr.5 when RM signal is ON and Pr.6 when RL signal is ON.
- The frequency from 4th speed to 15th speed can be set in accordance with the combination of the RH, RM, RL, and REX signals. Set the running frequencies in Pr.24 to Pr.27 and Pr.232 to Pr.239. (In the initial status, 4th speed to 15th speed are invalid.)

- Operates at the frequency set in Pr.6 when RH, RM, or RL is OFF and REX is ON while Pr.232 Multi-speed setting (speed 8) =
- Speed (frequency) can be compensated for the multi-speed setting and the remote setting by inputting the frequency setting compensation signal (terminals 1, 2).

Pr.28 setting	Description			
0 (initial value)	Without compensation			
1	With compensation			

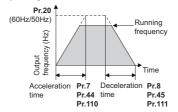

Acceleration/deceleration time

Pr.	GROUP	Name	Pr.	GROUP	Name
7	F010	Acceleration time	8	F011	Deceleration time
20	F000	Acceleration/ deceleration reference frequency	21	F001	Acceleration/ deceleration time increments
44	F020	Second acceleration/ deceleration time	45	F021	Second deceleration time
110	F030	Third acceleration/ deceleration time	111	F031	Third deceleration time
147	F022	Acceleration/ deceleration time switching frequency	791	F070	Acceleration time in low-speed range
792	F071	Deceleration time in low-speed range			

The following parameters are used to set motor acceleration/ deceleration time.

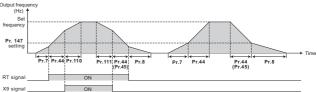

Set a larger value for a slower acceleration/deceleration, and a smaller value for a faster acceleration/deceleration.

- Use Pr.7 Acceleration time to set the acceleration time required to reach Pr.20 Acceleration/deceleration reference frequency from a stop status.
- Use Pr.8 Deceleration time to set the deceleration time required to reach a stop status from Pr.20 Acceleration/deceleration reference frequency

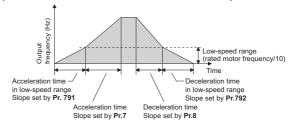

Pr.21 setting	[Description		
0 (initial value)	Increment: 0.1 s	Set the increment for the acceleration/deceleration time		
1	Increment: 0.01 s	setting.		

• Pr.44 and Pr.45 are valid when the RT signal is ON or when the output frequency is equal to or higher than the frequency set in Pr.147 Acceleration/deceleration time switching frequency.Pr.110 and Pr.111 are valid when the X9 signal is ON.

• If torque is required in the low-speed range (less than 10% of the rated motor frequency) under PM sensorless vector control, set the Pr.791 Acceleration time in low-speed range and Pr.792 Deceleration time in low-speed range settings higher than the Pr.7 Acceleration time and Pr.8 Deceleration time settings so that the mild acceleration/deceleration is performed in the lowspeed range. Enabled especially under the current synchronization operation.

(This function is not available for the FR-A842-P.)

Overheat protection of the motor (electronic thermal O/L relay)

Pr.	GROUP	Name	Pr.	GROUP	Name
9	H000	Electronic thermal O/L relay	51	H010	Second electronic thermal O/L relay
561	H020	PTC thermistor protection level	600	H001	First free thermal reduction frequency 1
601	H002	First free thermal reduction ratio 1	602	H003	First free thermal reduction frequency 2
603	H004	First free thermal reduction ratio 2	604	H005	First free thermal reduction frequency 3
607	H006	Motor permissible load level	608	H016	Second motor permissible load level
692	H011	Second free thermal reduction frequency 1	693	H012	Second free thermal reduction ratio 1
694	H013	Second free thermal reduction frequency 2	695	H014	Second free thermal reduction ratio 2
696	H015	Second free thermal reduction frequency 3	876	H022	Thermal protector input
1016	H021	PTC thermistor protection detection time			

Set the current for the electronic thermal O/L relay to protect the motor from overheating. Such a setting will provide the optimum protective characteristic considering the low cooling capability of the motor during low-speed operation.

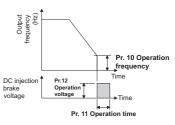

- This function detects the overload (overheat) of the motor and trips the inverter by stopping the operation of the transistor at the inverter output side.
- Set the rated motor current (A) in Pr.9.
 (If the motor has both 50 Hz and 60 Hz ratings and the Pr.3 Base frequency is set to 60 Hz, set to 1.1 times the 60 Hz rated motor current.
- Set "0" in Pr.9 to avoid activating the electronic thermal relay function; for example, when using an external thermal relay for the motor. (Note that the output transistor protection of the inverter is enabled. (E.THT))
- Mitsubishi Electric constant-torque motor Set one of "1, 13 to 18, 50, 53, or 54" in Pr.71. (This setting will enable the 100% constant-torque characteristic in the low-speed range.)
- When using an IPM motor (MM-CF), perform IPM parameter initialization to automatically set the rated current of the IPM motor.
- The outputs from the PTC thermistor built into the motor can be input to terminals 2 and 10. When the input from the PTC thermistor reaches the resistance value set in Pr.561, PTC thermistor operation (E.PTC) will be activated to shut off the inverter outputs.
- When the PTC thermistor protection level setting is used, use Pr.1016 to set the time from when the resistance of the PTC thermistor reaches the protection level until the protective function (E.PTC) is activated.
- The activation level of the electronic thermal O/L relay Pr.600 to Pr.604 (Pr.692 to Pr.696) can be varied according to the thermal characteristic of the motor.
- While the RT signal is ON, the setting values of Pr.51 and Pr.692 to Pr.696 are referred to provide thermal protection. Use the electronic thermal O/L relay function to drive two motors of different current ratings by one inverter. (To rotate two motors at once, use an external thermal relay.)
- To change the operational characteristic of the electronic thermal O/L relay, set the permissible load level in Pr.607 or Pr.608 according to the motor characteristics.
- Use Pr.876 to set valid/invalid status of terminal OH function when the FR-A8TP is installed.

DC injection brake, zero speed control, and servo lock

Pr.	GROUP	Name	Pr.	GROUP	Name
10	G100	DC injection brake operation frequency	11	G101	DC injection brake operation time
12	G110	DC injection brake operation voltage	802	G102	Pre-excitation selection
850	G103	Brake operation selection	1299	G108	Second pre- excitation selection

When stopping a motor, DC injection brake is applied to adjust the braking torque and timing to stop the motor.

By setting the frequency to operate the DC injection brake (zero speed control and servo lock) to Pr.10 DC injection brake operation frequency, the DC injection brake (zero speed control and servo lock) will operate when it reaches this frequency at the time of deceleration.

- Set the time applying the DC injection brake (zero speed control and servo lock) to Pr.11 DC injection brake operation time.
- Pr.12 DC injection brake operation voltage will set the percent against the power supply voltage. (Not used at the time of zero speed control or servo lock)
- Under Real sensorless vector control, Pr.850 can be used to select DC injection brake (setting value "0", initial value), zero speed control (setting value "1"), or magnetic flux decay output shutoff (setting value "2").
- When speed control is selected under vector control or PM sensorless vector control, pre-excitation braking operation by the LX signal can either be zero speed control or servo lock control. Pre-excitation is valid at LX signal ON.

Pr.802 (Pr.1299) Setting value	Braking operation	Description
0 (initial value)	Zero speed control	It will try to maintain 0 r/min so the motor shaft will not rotate even when a load is applied. However, it will not return to its original position when the shaft moves due to external force.
1	Servo lock	It will try to maintain the position of the motor shaft even if a load is applied. When the shaft moves due to external force, it will return to its original position after the external force is removed.

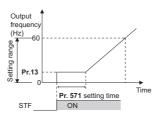

- For the vector control and PM sensorless vector control, set the frequency at where the zero speed control or servo lock control activates (Pr.10) and the operating period of the control (Pr.11).
 Use Pr.802 to select whether the zero speed control or servo lock control. During vector control, the initial value of Pr.10 is automatically set to 0.5 Hz.
- Turning ON the RT signal enables the second pre-excitation selection.

Starting frequency and start-time hold function Magnetic flux Sensorless

The starting frequency can be set and the starting frequency can be held for a certain period of time.

Set these functions when starting torque is needed or the motor drive at start needs smoothing.

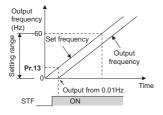

Minimum frequency at motor start and start-time hold function PM

Pr.	GROUP	Name	Pr.	GROUP	Name
13	F102	Starting frequency	571	F103	Holding time at a start

Set the frequency where the PM motor starts running.

- When setting a frequency with analog input, set the deadband in the low-speed range to eliminate noise and offset deviation.
- When the low-speed range high-torque characteristic function is enabled (Pr.788 = "9999"), the frequency level of 0.01 Hz is held for the time

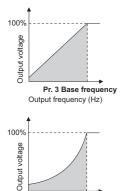

period of Pr.571 after turning ON the start signal.

patterns for various applications

Optimal output characteristics (V/F characteristics) for application or load characteristics can be selected. Available during V/F control.

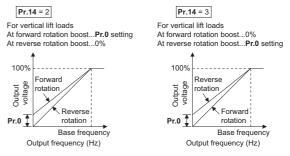

Pr. 3 Base freque

Output frequency (Hz)

- · Constant-torque load application (setting "0", initial value)
 - The output voltage will change linearly against the output frequency at the base frequency or lower.
 - Set this parameter when driving a load that has constant load torque even when the rotation speed is changed, such as a conveyor, dolly, or roll drive.
- Variable-torque load applications (setting value "1")
- The output voltage will change in square curve against the output frequency at the base frequency or lower. Set this parameter when driving a load

with load torque change proportionally against the square of the rotation speed, such as a fan or pump.

Vertical lift load applications (setting value "2, 3") Set "2" for a vertical lift load that is in power driving at forward rotation and in regenerative driving at reverse rotation. Pr.0 Torque boost is valid during forward rotation, and torque boost is automatically changed to "0%" during reverse rotation. Set "3" for the counterweight system, etc. that is in power driving at reverse rotation and in regenerative driving at forward rotation, according to the load weight.

Switching applied load selection with a terminal (setting value "4,

The RT and X17 signals enable the switching between the constant-torque load operation and lift operation.

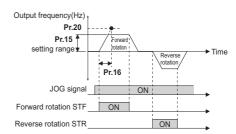

Pr.14 Setting value	RT(X17) signal	output characteristic		
4	ON	For constant-torque load (same as the setting value "0")		
"	OFF	For lift, boost at reverse rotation 0% (same as the setting value "2")		
5	ON	For constant-torque load (same as the setting value "0")		
9	OFF	For lift, boost at reverse rotation 0% (same as the setting value "3")		

JOG operation

P.	GROUP	Name	Pr.	GROUP	Name
15	D200	Jog frequency	16	F002	Jog acceleration/ deceleration time

The frequency and acceleration/deceleration time for JOG operation can be set. JOG operation is possible in both External operation and

JOG operation can be used for conveyor positioning, test operation,

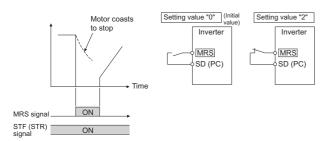

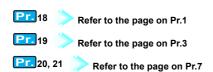

Inverter output shutoff signal

The inverter output can be shut off with the MRS signal. The logic of the MRS signal can also be selected.

When **Pr.17**="4", the MRS signal from an external terminal is be set as the normally closed (NC contact) input, and the MRS signal (output stop) via communication as the normally open (NO contact) input.

Stall prevention operation

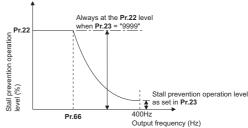

Pr.	GROUP	Name	Pr.	GROUP	Name
22	H500	Stall prevention operation level	23	H610	Stall prevention operation level compensation factor at double speed
48	H600	Second stall prevention operation level	49	H601	Second stall prevention operation frequency
66	H611	Stall prevention operation reduction starting frequency	114	H602	Third stall prevention operation level
115	H603	Third stall prevention operation frequency	148	H620	Stall prevention level at 0 V input
149	H621	Stall prevention level at 10 V input	154	H631	Voltage reduction selection during stall prevention operation
156	H501	Stall prevention operation selection	157	M430	OL signal output timer
858	T040	Terminal 4 function assignment	868	T010	Terminal 1 function assignment

This function monitors the output current and automatically changes the output frequency to prevent the inverter from tripping due to overcurrent, overvoltage, etc. It can also limit the stall prevention and fast-response current limit operation during acceleration/ deceleration and power/regenerative driving.

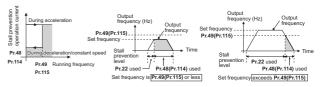

This function is disabled during Real sensorless vector control, vector control and PM sensorless vector control.

- Stall prevention
- If the output current exceeds the stall prevention operation level, the output frequency of the inverter is automatically changed to reduce the output current. Also the second and third stall prevention functions can limit the output frequency range in which the stall prevention function is enabled.
- Fast-response current limit
 If the current exceeds the limit value, the output of the inverter is shut off to prevent an overcurrent. (This function is not available for the FR-A842-P.)

- For Pr.22, set the ratio of the output current to the inverter rated current at which the stall prevention operation will be activated. Normally, this should be set at 150% (initial value). For the FR-A820-00250(3.7K) or lower and FR-A840-00126(3.7K) or lower, when the control method is changed from V/F control or Advanced magnetic flux vector control to Real sensorless vector control, or vector control, the Pr.22 setting changes from 150% (initial value) to 200%.
- To set the stall prevention operation level with the analog signal via terminal 1 (terminal 4), set Pr.868 (Pr.858)="4". Use Pr.148 and Pr.149 to adjust gain and bias for the analog signals.
- When operating at the rated motor frequency or higher, acceleration may not be made because the motor current does not increase. Also, when operating in the high-frequency range, the current flowing to the locked motor becomes less than the rated output current of the inverter; and even if the motor is stopped, the protective function will not operate (OL). In a case like this, the stall prevention level can be reduced in the high-frequency range to improve the motor's operating characteristics. This is useful when operating up to the high speed range, such as when using a centrifuge. Normally, set Pr.66 to 60 Hz, and Pr.23 to 100%.
- When Pr.23="9999" (initial value), the stall prevention operation level is constant at the Pr.22 level up to 590 Hz.

- By setting Pr.49="9999" and turning ON the RT signal, Pr.48 will be enabled.
- To enable Pr.114, set Pr.115≠ "0" and turn ON the X9 signal.
- Use Pr.48 (Pr.114) to set the stall prevention operation level applicable in the range between 0 Hz and the frequency set in Pr.49 (Pr.115).

Pr.49 setting	Pr.115 setting	Operation		
0 (initial value)		The second (third) stall prevention function disabled.		
0.01 Hz to 590 Hz		The second (third) stall prevention function operates according to the frequency.		
9999 Setting not available		The second stall prevention function operates according to the RT signal. RT signal ON: stall level Pr.48 RT signal OFF: stall level Pr.22		

- Use Pr.154 to further suppress the activation of the protective function (E.OC[], E.OV[]) during stall prevention operation.
- Use Pr.156 to suppress the stall prevention operation and the fast-response current limit in accordance with the operating status
- When Real sensorless vector control, vector control or PM sensorless vector control is selected using Pr.800, Pr.22 serves as the torque limit level.

Setting the torque limit level under speed control Sensorless Vector

Pr.	GROUP	Name	Pr.	GROUP	Name
22	H500	Stall prevention operation level (Torque limit level)	157	M430	OL signal output timer
801	H704	Output limit level	803	G210	Constant output range torque characteristic selection
804	D400	Torque command source selection	805	D401	Torque command value (RAM)
806	D402	Torque command value (RAM, EEPROM)	810	H700	Torque limit input method selection
811	D030	Set resolution switchover	812	H701	Torque limit level (regeneration)
813	H702	Torque limit level (3rd quadrant)	814	H703	Torque limit level (4th quadrant)
815	H710	Torque limit level 2	816	H720	Torque limit level during acceleration
817	H721	Torque limit level during deceleration	858	T040	Terminal 4 function assignment
868	T010	Terminal 1 function assignment	874	H730	OLT level setting

During speed control under Real sensorless vector control, vector control and PM sensorless vector control, the output torque is limited to prevent it from exceeding a specified value.

- The torque limit level can be set in a range of 0 to 400% using **Pr.22**. When the TL signal is ON, the torque limit level 2 (Pr.815) is enabled.
- The torque limit level can be selected by setting it with a parameter, or by using analog input terminals (terminals 1, 4). Also, the torque limit level at forward rotation (power driving/ regenerative driving) and reverse rotation (power driving/ regenerative driving) can be set individually.

Pr.	Setting range	Description
	0 (initial value)	Torque limit by parameter setting
810	1	Torque limit using the analog signals input to terminals 1 and 4.
	2	Torque limit by communication options
812	0 to 400%	Set the torque limit level for forward rotation regenerative driving.
012	9999 (initial value)	Limit using Pr.22 or the analog terminal values.
813	0 to 400%	Set the torque limit level for reverse rotation power driving.
013	9999 (initial value)	Limit using Pr.22 or the analog terminal values.
814	0 to 400%	Set the torque limit level for reverse rotation regenerative driving.
014	9999 (initial value)	Limit using Pr.22 or the analog terminal values.

- When inputting an analog signal from terminal 1 (4) to set the torque limit level, set Pr.810="1" or Pr.868 (Pr.858)="4".
- The torque limit value can be input via CC-Link (using the FR-A8NC) or CC-Link IE Field network (using the FR-A8NCE or FR-A800-GF) communication.
- Use Pr.816 and Pr.817 to set the torque limit value during acceleration/deceleration.
- To avoid overload or overcurrent of the inverter or motor, use Pr.801 Output limit level to limit the torque current.

Pr.801 setting Description				
0 to 400%	Set the torque current limit level.			
9999	Torque current limit using torque limit setting value (Pr.22 , Pr.812 to Pr.817 , etc.)			

For the torque limit operation during Real sensorless vector control and vector control, use Pr.803 to change the torque characteristic in the low-speed range and in the constant output range.

Pr.803	Torque characteristic in	Torque characteristic in constant- outpu range				
setting	low-speed range	Torque characteristic	Output limit			
0 (initial value)	Torque changes according to the scaling factor set in Pr.86 . *I	Constant motor output	_			
1	Constant torque	Constant torque	Without			
2	Constant torque	Constant torque	With			
10	Constant torque	Constant motor output	_			
11	Torque changes according to the scaling factor set in Pr.86 . *1	Constant torque	Without			

- This function is only available under Real sensorless vector control. The upper limit of the torque at 0 Hz is determined by multiplying the torque limit in the constant-torque range by the scaling factor set in Pr.86.
- The inverter can be set to trip at activation of torque limit operation and stalling of the motor. Use Pr.874 to set the output torque where the protective function activates.
- Use Pr.811 to change the parameter setting increment for the torque limit setting from 0.1% to 0.01%.
- If Pr.800 is used to select V/F control or Advanced magnetic flux vector control, the Pr.22 setting operates as the stall prevention operation level.

Pr. 24 to 28 > Refer to the page on Pr.4

Acceleration/deceleration pattern and backlash measures

Pr.	GROUP	Name	Pr.	GROUP	Name
29	F100	Acceleration/ deceleration pattern selection	140	F200	Backlash acceleration stopping frequency
141	F201	Backlash acceleration stopping time	142	F202	Backlash deceleration stopping frequency
143	F203	Backlash deceleration stopping time	380	F300	Acceleration S- pattern 1
381	F301	Deceleration S- pattern 1	382	F302	Acceleration S- pattern 2
383	F303	Deceleration S- pattern 2	516	F400	S-pattern time at a start of acceleration
517	F401	S-pattern time at a completion of acceleration	518	F402	S-pattern time at a start of deceleration
519	F403	S-pattern time at a completion of deceleration			

The acceleration/deceleration pattern can be set according to the application

In addition, the backlash measures, which stop acceleration/ deceleration at certain frequency or time set in parameters during acceleration/deceleration, can be set.

· Linear acceleration/deceleration (setting value "0", initial value) When the frequency is changed for acceleration, deceleration, etc. during inverter operation, the output frequency is changed linearly (linear acceleration/ deceleration) to reach the set frequency without straining the motor and inverter.

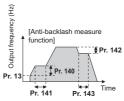

- value "1") For the main shaft of a machine, etc. Use this when quick acceleration/ deceleration is required to reach a highspeed area equal to or higher than the base
- Set f (Hz) Output fi f2
- S-pattern acceleration/deceleration B (setting value "2")

S-pattern acceleration/deceleration A (setting

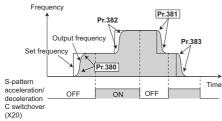

This is useful for preventing stacks from collapsing on a conveyor, etc. S-pattern acceleration/deceleration B can reduce the impact during acceleration/ deceleration by accelerating/decelerating in an S-pattern from the present frequency (f2) to the target frequency (f1).

Backlash measures (setting value "3", Pr.140 to Pr.143) To avoid backlash, acceleration/deceleration is temporarily stopped. Set the acceleration/deceleration stopping frequency and time in Pr.140 to Pr.143.

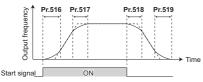

S-pattern acceleration/deceleration C (setting value "4", Pr.380 to Pr.383)

The acceleration/deceleration curve is switched by the S-pattern acceleration/deceleration C switchover (X20) signal. Set the ratio (%) of time for drawing an S-shape in Pr.380 to Pr.383 with the acceleration time as 100%

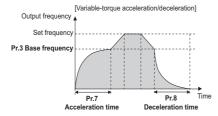

S-pattern acceleration/deceleration D (setting value "5", Pr.516 to Pr.519)

Set the time required for S-pattern operation part of S-pattern acceleration/deceleration with Pr.516 to Pr.519

Variable-torque acceleration/deceleration (Pr.29="6") This function is useful for variable-torque load such as a fan or blower to accelerate/decelerate in short time. In areas where output frequency > base frequency, the speed accelerates/decelerates linearly

Selecting the regenerative brake and DC feeding

Pr.	GROUP	Name	Pr.	GROUP	Name
30	E300	Regenerative function selection	70	G107	Special regenerative brake duty
599	T721	X10 terminal input selection			

- By using the optional high-duty brake resistor (FR-ABR) or the brake unit (FR-BU2, BU, FR-BU), the regenerative brake duty can be increased for the operation with frequent starts and stops.
- The multifunction regeneration converter (FR-XC in power regeneration mode), power regeneration common converter (FR-CV) (for 55K or lower), and power regeneration converter (MT-RC) (for 75K or higher) are used for continuous operation during regenerative driving.
- The high power factor converter (FR-HC2) and multifunction regeneration converter (FR-XC in common bus regeneration mode) can also be used for harmonic suppression and power factor improvement.
- For standard models and IP55 compatible models, it is possible to choose between the DC feeding mode 1, which will operate with DC power supply (terminals P and N), and DC feeding mode 2, which will normally operate in AC power supply (terminals R, S, and T) and operate in DC power supply (terminal P and N), such as batteries, at the time of power failure.
- Standard model For FR-A820-03160(55K) or lower and FR-A840-01800(55K) or lower

- Used in combination with GZG, GRZG, or FR-BR
- Used in combination with MT-BR5 Setting for the FR-A820-00490(7.5K) or lower and FR-A840-*3 00250(7.5K) or lower
- Setting for the FR-A820-00630(11K) or higher and FR-A840-00310(11K) or higher
- When set to Pr.599 = "1", X10 signal can be changed to normally closed (NC contact) input specification.

Avoiding machine resonance points (frequency jump)

Pr.	GROUP	Name	Pr.	GROUP	Name
31	H420	Frequency jump 1A	32	H421	Frequency jump 1B
33	H422	Frequency jump 2A	34	H423	Frequency jump 2B
35	H424	Frequency jump 3A	36	H425	Frequency jump 3B
552	H429	Frequency jump			
332	11723	range			

When it is desired to avoid resonance attributable to the natural frequency of a mechanical system, these parameters allow resonant frequencies to be jumped.

- · Up to three areas can be set, with the jump frequencies set to either the top or bottom point of each area.
- The frequency jumps 1A, 2A, 3A can be set and operation is performed at these frequencies in the jump areas.
- At the initial setting "9999", frequency jumps are not performed.
- During acceleration/deceleration, the running frequency within the set area is valid.
- A total of six jump areas can be set Pr.552 by setting the common jump range for the frequencies set in Pr.31 to Pr.36.

Speed display and speed setting

	Pr.	GROUP	Name	Pr.	GROUP	Name
3	7	M000	Speed display	144	M002	Speed setting switchover
5	05	M001	Speed setting reference	811	D030	Set resolution switchover

The monitor display unit and the frequency setting on PU(FR-DU08/ FR-PU07) can be switched to motor speed and machine speed.

- The setting increment for each monitor is determined by the combination of Pr.37 and Pr.144. (The initial values are shown within the thick lines.)
- Use Pr.811 to change the increment for the running speed monitor and speed setting monitor (r/min) from 1 r/min to 0.1 r/
- Changing the number of motor poles using Pr.81 Number of motor poles will change the Pr.144 setting value.

Pr.37 setting value	Pr.144 setting value	Output frequency monitor	Set frequency monitor	Running speed monitor	Frequency setting parameter setting
	0	0.01 Hz	0.01 Hz	1 r/min *1*2	0.01 Hz
0 (initial value)	2 to 12	2 to 12 0.01 Hz 0.01 Hz 1 r/min		1 r/min *1*2	0.01 Hz
	102 to 112	1 r/min *1*2	1 r/min *1*2	1 r/min *1*2	1 r/min *1
0		0.01 Hz	0.01 Hz	1 (machine speed) *1	0.01 Hz
1 to 9998	2 to 12	1 (machine speed) *1	1 (machine speed) *1	1 (machine speed) *1	1 (machine speed) *1
	102 to 112	0.01 Hz	0.01 Hz	1 r/min *1*2	0.01 Hz

Conversion formula to the motor speed r/min Frequency × 120 / number of motor poles (Pr.144) Conversion formula to machine speed

Pr.37 × Frequency / Pr.505

For Pr.144 in the above formula, the value is "Pr.144 - 100" when "102 to 110" is set in **Pr.144**; and the value is "4" when **Pr.37**=0 and Pr.144=0.

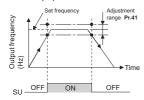

Use **Pr.811** to change the increment from 1 r/min to 0.1 r/min.

Output frequency detection

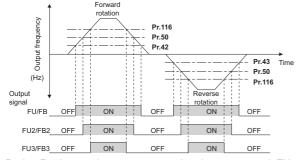

Pr.	GROUP	Name	Pr.	GROUP	Name
41	M441	Up-to-frequency sensitivity	42	M442	Output frequency detection
43	M443	Output frequency detection for reverse rotation	50	M444	Second output frequency detection
116	M445	Third output frequency detection	865	M446	Low speed detection
870	M400	Speed detection hysteresis			

The output frequency of the inverter is detected to output as an output signal.

- The **Pr.41** value can be adjusted within the range $\pm 1\%$ to $\pm 100\%$ considering the set frequency as 100%.
- This parameter can be used to check whether the set frequency has been reached, and provide signals such as the operation start signal for related equipment.

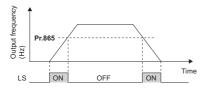

- Output frequency detection signal (FU, FB) is output when the output frequency reaches the Pr.42 setting or higher. This function can be used for electromagnetic brake operation, open signal, etc.
- Frequency detection dedicated to reverse rotation can also be set by setting the detection frequency to Pr.43. This is useful for changing the timing of the electromagnetic brake for forward rotation (lifting) and reverse rotation (lowering) in operations such as a lift operation.
- When outputting a frequency detection signal separately from the FU (FB) signal, set the detection frequency in Pr.50 or Pr.116. When the output frequency reaches the Pr.50 setting or higher, the FU2 (FB2) signal is output (when it reaches the Pr.116 setting or higher, the FU3 (FB3) signal is output).

- During Real sensorless vector control and vector control, FU (FU2, FU3) signal is output when the output frequency reaches the specified speed, and FB (FB2, FB3) signal is output when the actual motor speed (estimated actual rotations per minute) reaches the specified speed.
 - (Output timings of FU and FB signals are the same under V/F control, Advanced magnetic flux vector control, and encoder feedback control.)
- During Real sensorless vector control, vector control, and PM sensorless vector control, the LS signal is output when the output frequency drops to Pr.865 or lower.

During inverter operation, signals are output by the following conditions

To display the monitored items from the frequency setting value to the output terminal status on a parameter unit (FR-PU07), select "other monitor".

[&]quot;other monitor". The cumulative energization time and actual operation time are accumulated from 0 to 65535 hours, then cleared, and accumulated again from 0.

The actual operation time does not increase if the cumulative running time before power OFF is less than an hour. When using the parameter unit (FR-PU07), "kW" is displayed Differs according to capacities. (FR-A820-03160(55K) or lower

- and FR-A840-01800(55K)or lower/FR-A820-03800(75K) or higher and FR-A840-02160(75K) or higher)
- Since the voltage and current displays on the operation panel (FR-DU08) are shown in four digits, a monitor value of more than "9999" is displayed as "-
- When the output current is less than the specified current level (5% of the inverter rated current), the output current is monitored as 0 A.Therefore, the monitored value of an output current and output power may be displayed as "0" when using a much smaller-capacity motor compared to the inverter or in other instances that cause the output current to fall below the specified value
- Available when the option is connected.
- When Pr.37="1 to 9998" or Pr.144="2 to 12, 102 to 112", 1
- increment is used. (Refer to **page 124**)
 The monitored values are retained even if an inverter fault occurs. *10 Resetting will clear the retained values
- Can be set for the AM (Pr.158) only. *11
- Can be set or monitored only via communication. *12
- The setting is available for the standard model only.
- Setting **Pr.290** ≠ 0 enables the display/output with a minus sign. *14
- Setting **Pr.1018** = 0 enables the display/output with a minus sign.
- Negative values are not displayed on the operation panel. The values "-1 to -32767" are displayed as "65535 to 32769" on the operation panel
- The speed is not displayed on the FR-A842-P. Not available for the FR-A842-P.
- Pr.774 sets the output frequency monitor, Pr.775 sets the output current monitor, and Pr.776 sets the monitor description to be displayed at the output voltage monitor position. When Pr.774 to Pr.776="9999" (initial value), the Pr.52 setting value is used. (For the monitor display sequence, refer to page page 68.)
- Digits in the cumulative power monitor can be shifted to the right by the number set in Pr.891.
- Writing "0" in Pr.170 clears the cumulative power monitor.
- Pr.563 allows the user to check how many times the cumulative energization time monitor has exceeded 65535 h. Pr.564 allows the use to check how many times the actual operation time monitor has exceeded 65535 h.
- Writing "0" in Pr.171 clears the actual operation time monitor.

Pr.268 setting	Description
9999 (initial value)	No function
0	When monitoring with the first or second decimal place (0.1 increments or 0.01 increments), the 0.1 decimal place or lower is dropped to display an integral value (1 increments). The monitor value equal to or smaller than 0.99 is displayed as 0.
1	When monitoring with the second decimal place (0.01 increments), the 0.01 decimal place is dropped and the monitor displays the first decimal place (0.1 increments). When monitoring with the first decimal place, the display will not change.

• When Pr.52="100", the set frequency is displayed during stop, and output frequency is displayed during running. (LED of Hz blinks during stop and is lit during operation.)

Pr.52	0	100			
Operating status	During running/ stop	During stop	Running		
Output frequency	Output frequency	Set frequency	Output frequency		
Output current	Output current				
Output voltage	Output voltage				
Fault or alarm indication	Fault or alarm indication				

The monitored item to be displayed at the operation panel (FR-DU08)'s setting dial push can be selected with Pr.992

Pr.992	0	100		
Operating status	During running/ stop	During stop	Running	
Monitor displayed by the setting dial push	Set frequency (PU direct-in frequency)	Set frequency	Output frequency	

Depending on the Pr.290 setting, negative output can be selected for terminal AM (analog voltage output), and display with a minus sign is enabled for the operation panel and a communication option.

Pr.290 setting	Terminal AM output	Operation panel display	Monitoring on the communication option
0 (initial value)	-	-	-
1	Output with a minus sign	-	-
2	-	Displayed with a minus sign	-

299	A701	Rotation direction detection selection at restarting	611	F003	Acceleration time at a restart

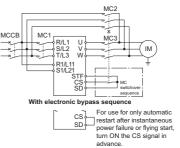

The inverter can be restarted without stopping the motor in the following conditions:

- When switching from commercial power supply operation over to inverter operation
- When an instantaneous power failure occurs during inverter operation
- When the motor is coasting at start

Pr.	Setting range	Description				
	0(initial value), 1000	Frequency search only performed at the first start				
	1, 1001	Reduced voltage start only at the first start (no frequency search)				
	2, 1002	Encoder detection frequency search				
162	3, 1003	Frequency search only performed at the first start (reduced mpact restart)				
	10, 1010	Frequency search at every start				
	11, 1011	Reduced voltage start at every start (no frequency search)				
	12, 1012	Encoder detection frequency search at every start				
	13, 1013	Frequency search at every start (reduced impact restart)				
	0 (initial value)	Without rotation direction detection				
299	1	With rotation direction detection				
200	9999	When Pr.78 Reverse rotation prevention selection = "0", with rotation direction detection Pr.78 Reverse rotation prevention selection = "1, 2", without rotation direction detection				
	0	Coasting time differs according to the inverter capacity.*1				
57	0.1 to 30s	Set the waiting time for the inverter to perform a restart after the power lost by an instantaneous power failure restores.				
	9999 (initial value)	No restart				
58	0 to 60 s	Set the voltage cushion time for restart.				
163	0 to 20 s	Set the voltage cushion time for restart.				
164	0 to 100%	Set a value considering the load amount (moment of inertia, torque).				
165	0 to 400%	Set the stall prevention level at restart considering the inverter rated current as 100%.				
611	0 to 3600 s	Set the acceleration time that takes to reach Pr.20 Acceleration/deceleration reference frequency setting at a restart.				
011	9999 (initial value)	Normal acceleration time setting (settings like Pr.7) is applied as the acceleration time for restart.				

The coasting time when Pr.57="0" is as shown below. (When Pr.162 is set to the initial value and the ND rating is selected. FR-A820-00105(1.5K) or lower and, FR-A840-00052(1.5K) or lower: 0.5s FR-A820-00167(2.2K) to FR-A820-00490(7.5K) and FR-A840-00083(2.2K) to FR-A840-00250(7.5K):1 s FR-A820-00630(11K) to FR-A820-03160(55K) and FR-A840-00310(11K) to FR-A840-01800(55K): 3.0 s FR-A820-03800(75K) or higher and, FR-A840-02160(75K) or higher : 5.0 s

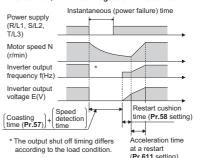

<Connection diagram>

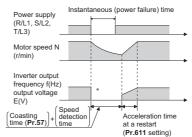

Only with restart after insta

- Pr.162="0 (initial value), 3, 10, or 13", the motor speed is detected at power restoration to start the motor smoothly.
- During encoder feedback control with Pr.162 = "2 or 12" or during vector control, the motor starts at power restoration based on the motor speed and rotation direction detected by the encoder. (This operation is available when a vector control compatible option is
- Setting Pr.162 = "3, 13" will lead to better-absorbed impacts and smoother motor start (Reduced impact restart) than the Pr.162 = "0, 10" setting does. (Offline auto tuning)
- Under Real sensorless vector control, the reduced impact restart is applied, independently of the Pr.162 setting.
- The encoder also detects the rotation direction during reverse rotation so that the inverter can re-start smoothly. (Pr.299 Rotation direction detection selection at restarting to enable/ disable the rotation direction detection)

V/F control, Advanced magnetic flux vector control

Real sensorless vector control

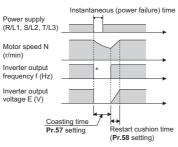

* The output shut off timing differs according to the load condition

• When Pr.162 = "1" or "11", automatic restart operation is performed in a reduced voltage system, where the voltage is gradually risen with the output frequency unchanged from prior to an instantaneous power failure independently of the coasting speed of the motor.

During Real sensorless vector control, the output frequency and voltage before an instantaneous power failure are output. (The Pr.58 setting is disabled.)

V/F control, Advanced magnetic flux vector control

^{*} The output shut off timing differs according to the load condition.

Automatic restart after instantaneous power failure with a PM motor 📭 🗷

Pr.	GROUP	Name	Pr.	GROUP	Name
57	A702	Restart coasting time	162	A700	Automatic restart after instantaneous power failure selection
611	F003	Acceleration time at a restart			

While using an IPM motor MM-CF, the inverter can be restarted without stopping the motor.

By enabling the automatic restart after instantaneous power failure function in the following conditions, the motor can be restarted.

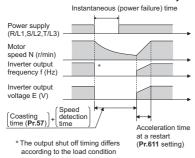

- · When an instantaneous power failure occurs during inverter operation
- When the motor is coasting at start

Pr.	Setting range	Description		
	0	No waiting time		
57	0.1 to 30 s	Set the waiting time for the inverter to perform a restart after the power lost by an instantaneous power failure restores.		
	9999 (initial value)	No restart		
162	0 (initial value), 1, 2, 3, 1000, 1001, 1002, 1003	Frequency search only performed at the first start		
102	10, 11, 12, 13, 1010, 1011, 1012, 1013	Frequency search at every start		
611	0 to 3600 s	Set the acceleration time that takes to reach Pr.20 Acceleration/deceleration reference frequency at a restart.		
011	9999 (initial value)	Standard acceleration time (for example, Pr.7) s applied as the acceleration time at restart.		

Selection for the automatic restart (Pr.162)

The motor speed is detected (frequency search) at power restoration to start the motor smoothly.

The encoder also detects the rotation direction during reverse rotation so that the inverter can re-start smoothly.

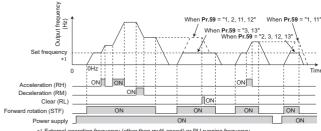

Remote setting function

	٦r.	GROUP	Name
59)	F101	Remote function selection

Even if the operation panel is located away from the enclosure, contact signals can be used to perform continuous variable-speed operation, without using analog signals.

Energy saving control selection

Magnetic flux

Pr. GROUP Name

Energy saving control selection Inverter will perform energy saving control automatically even when

the detailed parameter settings are made.

It is appropriate for an application such as a fan or pump.

Pr.60 setting	Description			
0(initial value)	Normal operation			
4	Energy saving operation*1 With the energy saving operation, the inverter will automatically control the output voltage so the inverter output power during the constant-speed operation will become minimal. (Available during V/F control)			
9	Optimum excitation control 1 The Optimum excitation control is a control method to decide the output voltage by controlling the excitation current so the efficiency of the motor is maximized. (Available during V/F control or Advanced magnetic flux vector control)			

Output current may increase slightly with the energy saving operation or the Optimum excitation control since the output voltage is controlled.

Automatic acceleration/deceleration Magnetic flux Sensorless Vector

Pr.	GROUP	Name	Pr.	GROUP	Name
61	F510	Reference current	62	F511	Reference value at acceleration
63	F512	Reference value at deceleration	64	F520	Starting frequency for elevator mode
292	F500	Automatic acceleration/	293	F513	Acceleration/ deceleration separate selection

The inverter can be operated with the auto-adjusted parameters.

- · Without setting the acceleration/deceleration time or the V/F pattern, the inverter can be operated as if the appropriate value is set to each parameter. This function is useful for operating the inverter without setting detailed parameters.
- Even if automatic acceleration/deceleration has been selected, inputting the JOG signal, RT signal (second function selection), or X9 signal (third function selection) during an inverter stop will switch to the normal operation and give priority to JOG operation, second function selection or third function selection. After the motor is started by the automatic acceleration/ deceleration, none of JOG, RT, or X9 signal is accepted.

Pr.292 setting		Operation	Automatic setting Pr.
0 (initial value normal operation)	_	_	
1 (shortest acceleration/ deceleration)	Without brake resistor or the brake unit	Set this parameter to accelerate/decelerate the motor at the shortest	Pr.7, Pr.8
11 (shortest acceleration/ deceleration)	With brake resistor, brake unit	time. (Stall prevention operation level 150%)	1 1.7, 1 1.0
3 (optimum acceleration/ deceleration)	Optimal operation	Pr.0, Pr.7, Pr.8	
5 (lift mode)	Stall prevention operation level 150%	The inverter output voltage is controlled so that enough torque is	Pr.0, Pr.13,
6 (lift mode 2)	Stall prevention operation level 180%	provided during power driving and regenerative driving.	Pr.19
7 (Brake sequence mode 1)	With machine brake opening completion signal	In this operation mode, operation timing signals of the mechanical brake	
8 (Brake sequence mode 2)	Without machine brake opening completion signal	are output from the inverter, such as for lift application.	_

- Pr.61 to Pr.63 can be used to change the reference current for the shortest acceleration/deceleration and the optimal acceleration/deceleration operation.
- Use **Pr.64** to set the starting frequency for the lift operation.
- Acceleration/deceleration times can be individually calculated. Such a setting can be enabled/disabled for the shortest acceleration/deceleration operation and the optimum acceleration/deceleration.

Pr.293 setting	Description
0 (initial value)	Both the acceleration and deceleration times are calculated.
1	Only the acceleration time is calculated.
2	Only the deceleration time is calculated.

Retry function

Pr.	GROUP	Name	Pr.	GROUP	Name
65	H300	Retry selection	67	H301	Number of retries at fault occurrence
68	H302	Retry waiting time	69	H303	Retry count display erase

This function allows the inverter to reset itself and restart at activation of the protective function (fault indication). The retry generating faults can be also selected.

(This function is not available for the FR-A842-P.)

When the automatic restart after instantaneous power failure function is selected (Pr.57 Restart coasting time ≠ 9999), the restart operation is also performed after a retry operation as well as after an instantaneous power failure.

· Using Pr.65, you can select the fault that will cause a retry. "•" indicates the faults selected for retry.

- *1 The setting is available for FR-A820-00630(11K) or lower.
- When initial values are set in Pr.0 and Pr.12, the Pr.0 and Pr.12 settings are automatically changed by changing the Pr.71 setting.

Carrier frequency and Soft-PWM selection

Pr.	GROUP	Name	Pr.	GROUP	Name
72	E600	PWM frequency selection	240	E601	Soft-PWM operation selection
260	E602	PWM frequency automatic switchover			

The motor sound can be changed.

I	Pr.	Setting range	Description		
	72 *3	0 to 15*1	The PWM carrier frequency can be changed. The setting displayed is in [kHz]. Note that 0 indicates 0.7		
	1 2*3	0 to 6, 25*2	kHz, 15 indicates 14.5 kHz, and 25 indicates 2.5 kl (When using an optional sine wave filter, set "25".)		
	240	0	Soft-PWM disabled		
	240	1 (initial value)	Soft-PWM enabled		
	260 *3	0	PWM carrier frequency automatic reduction function disabled (for the LD, ND, or HD rating)		
	200*3	1 (initial value)	PWM carrier frequency automatic reduction function enabled		

- *1 The setting range for the FR-A820-03160(55K) or lower and FR-A840-01800(55K) or lower.
- *2 The setting range for the FR-A820-03800(75K) or higher and FR-A840-02160(75K) or higher.
- *3 Not available for the FR-A842-P.
- Under Real sensorless vector control, vector control, and PM sensorless vector control, the following carrier frequencies are used. (For the control method and fast-response operation selection, refer to Pr.800 Control method selection refer to page 135

Pr.72	Carrier frequency (kHz)					
setting	Real sensorless vector control, vector control	PM sensorless vector control	fast-response operation selection			
0 to 5	2	6 *4				
6, 7	6*5	6				
8, 9	0*3	6	4			
10 to 13	10*5	10				
14, 15	14*5	14				

- *4 When low-speed range high-torque characteristic is disabled (Pr.788="0"), 2 kHz is used.
- *5 In the low-speed range (3 Hz or lower) under Real sensorless vector control, the carrier frequency is automatically changed to 2 kHz. (For FR-A820-00490(7.5K) or lower and FR-A840-00250(7.5K) or lower)
- PWM carrier frequency automatic reduction function (Pr.260)
 Setting Pr.260="1 (initial value)" will enable the PWM carrier
 frequency auto-reduction function. If a heavy load is continuously
 applied while the inverter carrier frequency is set to 3 kHz or
 higher (Pr.72 ≥ "3"), the carrier frequency is automatically
 reduced to prevent occurrence of the inverter overload trip
 (electronic thermal O/L relay function) (E.THT). The carrier
 frequency is reduced to as low as 2 kHz. (Motor noise increases,
 but not to the point of failure.)
- When the PWM carrier frequency automatic reduction function is used, the operation with the carrier frequency set to 3 kHz or higher (Pr.72 ≥ "3") automatically reduces the carrier frequency for heavy-load operation as shown below.

Pr.260	Pr.570	Carrier frequency automatic reduction operation				
setting	setting	FR-A820-04750(90K) or lower, FR-A840-02600(90K) or lower	FR-A840-03250(110K) or higher			
	0 (SLD), 1 (LD)		Continuous operation with the 85% or higher inverter rated current reduces the carrier frequency automatically.			
1	2 (ND), 3 (HD)	Operation with the 150% or higher inverter rated current for the ND rating reduces the carrier frequency automatically.	Continuous operation with the 85% or higher inverter rated current reduces the carrier frequency automatically.			
	0 (SLD)	Continuous operation with the 85% or higher inverter rated current reduces the carrier frequency automatically.				
	1 (LD)	Without carrier frequency automat (Perform continuous operation with or lower or with less than 85% of the	n the carrier frequency set to 2 kHz			
0	2 (ND), 3 (HD)	Without carrier frequency automatic reduction	Without carrier frequency automatic reduction (Perform continuous operation with the carrier frequency set to 2 kHz or lower or with less than 85% of the rated inverter current.)			

 In the low-speed range (about 10 Hz or lower), the carrier frequency may be automatically lowered. Motor noise increases, but not to the point of failure.

Analog input selection

Pr.	GROUP	Name	Pr.	GROUP	Name
73	T000	Analog input selection	267	T001	Terminal 4 input selection

17	0 to 20 mA	ON	0 to ±5 V	Addition compensation		

- Turning ON the Terminal 4 input selection (AU) signal sets terminal 4 to the main speed.
- Set the Pr.267 and voltage/current input switch setting according to the table below.

Pr.267 setting	Terminal 4 input	Switch 2
0 (initial value)	4 to 20 mA	ON
1	0 to 5 V	OFF
2	0 to 10 V	OFF

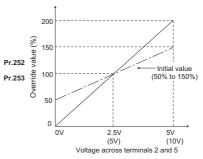

Addition compensation (Pr.242, Pr.243) A compensation signal is addable to the main speed setting for such as synchronous or continuous speed control operation.

Terminal 1 (frequency setting auxiliary input) is added to terminal 2 or 4 main speed setting signal.

Override function (Pr.252, Pr.253)

When the override setting is selected, terminal 1 or 4 is set to the main speed setting, and terminal 2 is set to the override signal. (If the main speed of terminal 1 or 4 is not input, the compensation by terminal 2 is disabled.)

• When Pr.868 (Pr.858) = "4", the terminal 1 (terminal 4) values are set to the stall prevention operation level.

Analog input responsiveness and noise elimination

Pr.	GROUP	Name	Pr.	GROUP	Name
74	T002	Input filter time constant	822	T003	Speed setting filter 1
826	T004	Torque setting filter 1	832	T005	Speed setting filter 2
836	T006	Torque setting filter 2	849	T007	Analog input offset adjustment

The frequency command/torque command response level and stability are adjustable by using the analog input (terminals 1, 2, and 4) signal.

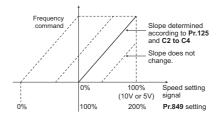

- · Pr.74 is effective to eliminate noise on the frequency setting
 - Increase the filter time constant if steady operation cannot be performed due to noise, etc.
 - A larger setting results in slower response. (The time constant can be between 0 and 8, which are about 2 ms to 1 s.)
- Set the primary delay filter time constant to the external speed command (analog input command) by using Pr.822 or Pr.832. Set a larger time constant when delaying the speed command tracking or the analog input voltage is unstable.
- Set the primary delay filter time constant to the external torque command (analog input command) by using Pr.826 or Pr.836. Set a larger time constant when delaying the torque command tracking or the analog input voltage is unstable.
- Set a value other than "9999" in Pr.832 and Pr.836, which are enabled when the RT signal is ON.
- Setting Pr.849 will offset the analog speed input (terminal2) and avoid the occurrence of a frequency command due to noise when the 0-speed command is given.

The offset voltage is positive when 100% < Pr.849 and negative when Pr.849 < 100%. The detailed calculation of the offset voltage is as described below:

Offset voltage [V] =

Voltage at the time of 100% (5 V or 10 V*1) × (Pr.849 - 100)/100

It depends on the Pr.73 setting.

Reset selection/disconnected PU detection/PU stop selection

Pr.	GROUP	Name
75	E100	Reset selection
75	E101	Disconnected PU detection
75	E102	PU stop selection
75	E107	Reset limit
75	-	Reset selection/ disconnected PU detection/ PU stop selection

The reset input acceptance, disconnected PU (FR-DU08/FR-PU07) connector detection function and PU stop function can be selected.

Pr.75 setting	Reset selection	Disconnected PU detection	PU stop selection	
0, 100	Reset input always enabled	Operation continues even		
1, 101	Reset input enabled only when protective function activated	when PU is disconnected.	Decelerates to a stop when STOP RESET	
2, 102	Reset input always enabled	Inverter output shut	is input in PU operation mode	
3, 103	Reset input enabled only when protective function activated	off when PU disconnected.	only.	
14 (Initial value), 114	Reset input always enabled	Operation continues even	Decelerates to a	
15, 115	Reset input enabled only when protective function activated	when PU is disconnected.	stop when STOP RESET is input in any of	
16, 116	Reset input always enabled	Inverter output shut	the PU, external and communication operation modes.	
17, 117	Reset input enabled only when protective function activated	off when PU disconnected.	operation modes.	

- Reset selection (P.E100)
 - When **P.E100** = "1" or **Pr.75** = "1, 3, 15, 17, 100, 101, 103, 115, or 117" is set, reset (reset command via RES signal or communication) input is enabled only when the protective function is activated.
- Disconnected PU detection (P.E101) If the PU (FR-DU08/FR-PU07) is detected to be disconnected from the inverter for 1 s or longer while **P.E101** = "1" or **Pr.75** = "2, 3, 16, 17, 102, 103, 116, or 117", PU disconnection (E.PUE) is displayed and the inverter output is shut off.
- PU stop selection (P.E102)

Stop can be performed by inputting STOP from the PU in any of the operation modes of PU operation, External operation and network operation.

Reset limit function (P.E107)

When **Pr.75** = any of "100 to 103 and 114 to 117", if an electronic thermal O/L relay or an overcurrent protective function (E.THM, E.THT, E.OC[]) is activated while one of them has been already activated within 3 minutes, the inverter will not accept any reset command (RES signal, etc.) for about 3 minutes from the second activation.

The reset limit function is available with the FR-A820-03800(75K) or higher and FR-A840-02160(75K) or higher.

Fault code output function

When a fault occurs, the corresponding data can be output as a 4-bit digital signal using via an open collector output terminal. The fault code can be read using a programmable controller, etc.,

and countermeasures can be displayed on the HMI (Human Machine Interface), etc.

Pr.76 setting	Description
0 (initial value)	Without fault code output
1	With fault code output (Refer to the table below.)
2	Fault code is output only when a fault occurs. (Refer to the table below.)

The fault codes that can be output are shown in the table below. (0: Output transistor OFF, 1: Output transistor ON)

Operation panel	Outp	ut termi	nal oper	ation	
indication (FR- DU08)	SU	IPF	OL	FU	Fault code
Normal *1	0	0	0	0	0

E.OLT	1	1	0	1	D
E.OPT E.OP1	1	1	1	0	Е
Other than the above	1	1	1	1	F

When Pr.76 = "2", the terminal outputs the signal assigned by Pr.191 to Pr.194 in normal operation.

Parameter write selection

Pr.	GROUP	Name
77	E400	Parameter write selection

Whether to enable the writing to various parameters or not can be selected. Use this function to prevent parameter values from being rewritten by misoperation.

Pr.77 setting	Description			
0 (initial value)	Writing is enabled only during stop.			
1	Parameter writing is disabled.			
Parameter writing is enabled in any operation mode regardless of the operation status. (Writing is disabled for some parameters.)				

Reverse rotation prevention selection

Pr.	GROUP	Name
78	D020	Reverse rotation prevention selection

This function can prevent reverse rotation fault resulting from the incorrect input of the start signal.

Pr.78 setting	Description
0 (initial value)	Both forward and reverse rotations allowed
1	Reverse rotation disabled
2	Forward rotation disabled

Operation mode selection

Pr.	GROUP	Name	<mark>P'</mark>	GROUP	Name
79	D000	Operation mode selection	340	D001	Communication startup mode selection

Select the operation mode of the inverter.

The mode can be changed among operations using external signals (External operation), operation by operation panel (FR-DU08) or parameter unit (FR-PU07) (PU operation), combined operation of PU operation and External operation (External/PU combined operation), and Network operation (when RS-485 terminals or communication option is used).

Pr.79		Description		LED display	
setting				□: ON	
0 (initial value)	Use the Extern to switch betwoeperation model At power ON, operation model.	PU operation mode PU EXT NET External operation mode PU EXT NET operation mode PU EXT NET operation			
	Operation mode	Frequency command	Start command		
1	PU operation mode fixed	Operation panel (FR-DU08) and PU(FR-PU07)	or PU (FR-DU08/FR-PU07)	PU operation mode PU EXT NET	
2	External operation mode fixed. The operation can be performed by switching between the External and NET operation modes.	External signal input (terminal 2 and 4, JOG, multispeed selection, etc.)	External signal input (terminal STF, STR)	External operation mode PU EXT NET operation mode PU EXT NET

7	modes can be performed during operation. External operation mode (PU operation interlock) X12 signal ON: Switchover to PU operation mode enabled (during External operation, output shutoff) X12 signal OFF: Switchover to PU operation mode disabled PU EXT NET operation mode				

Selecting the operation mode for power-ON (Pr.340) When power is switched ON or when power comes back ON after an instantaneous power failure, the inverter can be started up in the Network operation mode.

After the inverter starts up in Network operation mode, parameter writing and operation can be commanded from programs. Set this mode when performing communication operation using the RS-485 terminals or a communication option.

Use Pr.79 and Pr.340 to set the operation mode at power-ON (reset).

Pr.340 setting	Pr.79 setting	Operation mode at power-ON, at power restoration, or after a reset.	Operation mode switching
0 (initial value)	Follows th	ne Pr.79 setting.	
	0	NET operation mode	Switching among the External, PU, and NET operation modes is enabled _{*2}
	1	PU operation mode	PU operation mode fixed
	2	NET operation mode	Switching between the External and NET operation modes is enabled. Switching to PU operation mode is disabled
1, 2 •1	3, 4	External/PU combined operation mode	Operation mode switching is disabled
., _ ·	6	NET operation mode	Switching among the External, PU, and NET operation mode is enabled while running.
	7	X12 (MRS) signal ON NET operation mode	Switching among the External, PU, and NET operation modes is enabled
		X12 (MRS) signal OFF External operation mode	External operation mode fixed (Forcibly switched to External operation mode)
	0	NET operation mode	Switching between the PU and NET operation mode is enabled *3
	1	PU operation mode	PU operation mode fixed
	2	NET operation mode	NET operation mode fixed
10, 12 *1	3, 4	External/PU combined operation mode	Operation mode switching is disabled
	6	NET operation mode	Switching between the PU and NET operation mode is enabled while running _{*3}
	7	External operation mode	External operation mode fixed (Forcibly switched to External operation mode)

- Use Pr.340 = "2 or 12" setting to perform communication with the RS-485 terminals. Even if an instantaneous power failure occurs while Pr.57 Restart coasting time≠ "9999" (with automatic restart after
 - instantaneous power failure), the inverter continues operation at the condition before the instantaneous failure.
- The operation mode cannot be directly changed between the PU operation mode and Network operation mode.
- Switching between the PU and NET operation modes is available with the PU key on the operation panel (FR-DU08) and the X65 signal.

Changing the control method

Offline auto tuning operation can be executed to automatically calculate the motor constant under Advanced magnetic flux vector control, Real sensorless vector control, vector control, or PM sensorless vector control.

Offline tuning is necessary under Real sensorless vector control. Also, when the automatic restart after instantaneous power failure or flying start function is used under V/F control or with an IPM motor MM-CF, offline auto tuning improves the precision of the frequency search for motor speed detection.

Pr. 96 setting Description					
0 (initial value)	No offline auto tuning				
1 *1	Performs offline auto tuning without rotating the motor				
101 *1	Performs offline auto tuning by rotating the motor				
11 *2	Performs offline auto tuning without rotating the motor (V/F control, PM sensorless vector control (IPM motor MM-CF)).				

- *1 For Advanced magnetic flux vector control, Real sensorless vector control and vector control
- *2 For V/F control and PM sensorless vector control
- The offline tuning data (motor constants) can be copied to another inverter with the operation panel (FR-DU08).
- Even if a motor other than Mitsubishi Electric standard motors (SF-JR 0.4 kW or higher), high-efficiency motors (SF-HR 0.4 kW or higher), Mitsubishi Electric constant-torque motors (SF-JRCA 4P, SF-HRCA 0.4 kW to 55 kW), Mitsubishi Electric high-performance energy-saving motor SF-PR, or Mitsubishi Electric vector-dedicated motors (SF-V5RU (1500 r/min series)), such as other manufacturers' induction motors, SF-JRC, SF-TH, etc., is used, or when the wiring length is long (approx. 30 m or longer), an inductive motor can run with the optimum operation characteristics by using the offline auto tuning function.
- The offline auto tuning enables the operation with SPM motors and IPM motors other than MM-CF when using the PM motor.
 When using a PM motor other than the IPM motor MM-CF series, offline auto tuning must be performed.
- When using an induction motor, the motor rotation can be locked (Pr.96 = "1, 11") or unlocked (Pr.96 = "101").
 The tuning is more accurate when the motor can rotate (unlocked).
- · Requirements for offline auto tuning
 - · A motor is connected.
 - For the motor capacity, the rated motor current should be equal to or less than the inverter rated current. (It must be 0.4 kW or higher.)

Using a motor with the rated current substantially lower than the inverter rated current will cause torque ripples, etc. and degrade the speed and orque accuracies. As a reference, select the motor with the rated motor current that is about 40% or higher of the inverter rated current.

- · The highest frequency is 400 Hz.
- The target motor is other than a high-slip motor, a high-speed motor, or a special motor.
- When using an induction motor, check the following points if Pr.96 (Pr.463) = "101" (Perform offline auto tuning by rotating the motor) is selected.
 - · Torque is not sufficient during tuning.
 - The motor can be rotated up to the frequency close to the motor rated frequency (Pr.84 setting value).
 - The brake is released.
- The motor may rotate slightly even if Pr.96 (Pr.463) = "1, 11" (performs tuning without rotating the motor) is selected. Fix the motor securely with a mechanical brake, or before tuning, make sure that it is safe even if the motor rotates.

Make sure to perform the above especially in vertical lift applications.

Note that if the motor runs slightly, tuning performance is unaffected.

Excitation current low-speed scaling factor Magneticifiux Sensorless

Pr.	GROUP	Name	Pr.	GROUP	Name

Pr.	Setting range	Description
	0 to 300%	Set an excitation current low-speed scaling factor when the RT signal is ON.
566	9999 (initial value)	SF-PR/SF-HR/SF-HRCA motor: The predetermined scaling factor is applied. Motor other than the above: 130% is applied.

- The setting is applied to the operation under V/F control.
- The setting is valid only under Advanced magnetic flux vector control or Real sensorless vector control. When **Pr.14** = "12 to 15" *2 and V/F control is selected, the operation is the same as the one for constant-torque load (Pr.14 = "0").

Refer to the page on Pr.80.

Online auto tuning Magnetic flux Sensorless Vector

Pr.	GROUP	Name	Pr.	GROUP	Name
95	C111	Online auto tuning selection	574	C211	Second motor online auto tuning

If online auto tuning is selected, favorable torque accuracy is retained by adjusting temperature even when the resistance value varies due to increase in the motor temperature.

When vector control is used, select the magnetic flux observer.

Pr.95 Pr.574		Description	
0 (initial value)		Do not perform online auto tuning	
1		Perform online auto tuning at startup	
2		Magnetic flux observer (tuning always)	

- Perform offline auto tuning before performing online auto tuning at startup.
- When performing the online auto tuning at start for a lift, consider utilization of a brake sequence function for the brake opening timing at a start or tuning using the external terminal. The tuning is completed in approximately 500 ms at the maximum after the start. Not enough torque may be provided during that period. Caution is required to prevent the object from dropping.
- Offline auto tuning is not necessary if selecting magnetic flux observer for the SF-V5RU, SF-JR (with encoder), SF-HR (with encoder), SF-JRCA (with encoder) or SF-HRCA (with encoder). (However, when the wiring length is long (30 m or longer as a reference), perform offline auto tuning so that the resistance for the wiring length can be reflected to the control.)

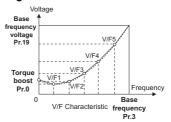

Adjustable 5 points V/F Magnetic flux

71	C100	Applied motor	100	G040	V/F1 (first frequency)
101	G041	V/F1 (first frequency voltage)	102	G042	V/F2 (second frequency)
103	G043	V/F2 (second frequency voltage)	104	G044	V/F3 (third frequency)
105	G045	V/F3 (third frequency voltage)	106	G046	V/F4 (fourth frequency)
107	G047	V/F4 (fourth frequency voltage)	108	G048	V/F5 (fifth frequency)
109	G049	V/F5 (fifth frequency voltage)			

By setting a desired V/F characteristic from the start up to the base frequency or base voltage with the V/F control (frequency voltage/ frequency), a dedicated V/F pattern can be generated. Optimal V/F patterns that match the torque characteristics of the facility can be set.

- Set Pr.71 = "2" and set a voltage and frequency in Pr.100 to Pr.109
- Read only error (Er-1) is generated when the frequency value for each point is the same. Also, set the frequency and voltage within the range of Pr.3 Base frequency and Pr.19 Base frequency voltage.

• At the time of Pr.19 Base frequency voltage = "8888, 9999" setting of Pr.71 = "2" cannot be made. When setting Pr.71 = "2", set the rated voltage value in Pr.19.

Set the action when the inverter is performing operation via communication.

Initial settings and specifications of RS-485 communication (Pr.117 to Pr.124, Pr.331 to Pr.337, Pr.341)

Use the following parameters to perform required settings for the RS-485 communication between the inverter and a personal computer. (Setting Pr.331 to Pr.337, Pr.341, Pr.343, Pr.539, or Pr.549 is not available for the FR-A800-E.)

- There are two types of communication, communication using the inverter's PU connector and communication using the RS-485 terminals
- Parameter setting, monitoring, etc. can be performed using the Mitsubishi inverter protocol or MODBUS RTU communication protocol.
- To establish communication between the computer and inverter, setting of the communication specifications must be made to the inverter in advance.
- Data communication cannot be established if the initial settings are not made or if there is any setting error.

Pr.	Setting range	Description		
117 331	0 to 31 (0 to 247)*1	Specify the inverter station number. Set the inverter station numbers when two or more inverters are connected to one personal computer.		
118 332	48, 96, 192, 384, 576, 768, 1152 (3, 6, 12, 24)-2	Set the communication s The setting value × 100 communication speed. For example, if 192 is se speed is 19200 bps.	equals the

• CC-Link IE Field Network Basic function setting (FR-

The CC-Link IE Field Network Basic enables CC-Link IE communication using the general-purpose Ethernet-based technology. The CC-Link IE Field Network Basic is suited to small-scale equipment for which high-speed control is not necessary, and can coexist with the standard Ethernet TCP/IP (HTTP, FTP, etc.). (Pr.544 can be set only when the FR-A800-E is used or a compatible plug-in option is installed.)

Pr.	Setting range	Description	
541	0 (initial value)	Frequency command without sign	
341	1	Frequency command with sign	
544	0 (initial value), 1, 12, 14, 18, 24, 28, 100, 112, 114, 118, 128	The function of the remote registers can be extended when the CC-Link IE Field Network Basic is used.	

CC-Link IE Field Network function setting (FR-A800-GF)

Use the following parameters to perform required settings for CC-Link IE Field Network communication between the inverter and other stations. (Pr.349, Pr.500, and Pr.501 can be set only when the FR-A800-GF inverter is used or when a compatible plug-in option is installed to the FR-A800 inverter.)

Pr.	Setting range	Description
434	0 to 255	Set the inverter network number.
435	0 to 255	Set the inverter station number.
541	0 (initial value)	Frequency command without sign
341	1	Frequency command with sign

• CC-Link IE TSN communication function setting

Use the following parameters to perform required settings for CC-Link IE TSN communication between the inverter and other devices.

Data can be transmitted to IT systems while performing real-time cyclic communication control.

Pr.	Setting range	Description				
434						
435	0 to 255	Enter the IP address of the inverter to be connected to CC-Link IE TSN.				
436						
437						
438						
439	0 to 255	Enter the subnet mask of the network to				
440		which the inverter belongs.				
441

C6 (904)	T401	Terminal 4 frequency setting bias	C7 (905)	T403	Terminal 4 frequency setting gain
C12 (917)	T100	Terminal 1 bias frequency (speed)	C13 (917)	T101	Terminal 1 bias (speed)
C14 (918)	T102	Terminal 1 gain frequency (speed)	C15 (918)	T103	Terminal 1 gain (speed)
C16 (919)	T110	Terminal 1 bias command (torque/ magnetic flux)	C17 (919)	T111	Terminal 1 bias (torque/magnetic flux)
C18 (920)	T112	Terminal 1 gain command (torque/ magnetic flux)	C19 (920)	T113	Terminal 1 gain (torque/magnetic flux)
C38 (932)	T410	Terminal 4 bias command (torque/ magnetic flux)	C39 (932)	T411	Terminal 4 bias (torque/magnetic flux)
C40 (933)	T412	Terminal 4 gain command (torque/ magnetic flux)	C41 (933)	T413	Terminal 4 gain (torque/magnetic flux)
241	M043	Analog input display unit switchover			

The degree (slope) of the output frequency (speed, torque/magnetic flux) to the frequency/torque setting signal (0 to 5 V DC, 0 to 10 V DC or 4 to 20 mA) is selectable to a desired amount.

- To change the frequency (speed) for the maximum analog input (Pr.125, Pr.126, C14 (Pr.918))
- To change only the frequency setting (gain) for the maximum analog input voltage (current), set Pr.125 (Pr.126, C14 (Pr.918)). (Other calibration parameter settings do not need to be changed.)
- To change the torque/magnetic flux for the maximum analog input (C18 (Pr.920), C40 (Pr.933))
 - To change only the torque/magnetic flux command of the maximum analog input voltage (current), set to C18 (Pr.920), C40 (Pr.933). (Other calibration parameter settings do not need to be changed.)
- Calibration of analog input bias and gain (C2 (Pr.902) to C7 (Pr.905), C16 (Pr.919) to C19 (Pr.920), C38 (Pr.932) to C41 (Pr.933))

The "bias" and "gain" functions are used to adjust the relationship between the output frequency (torque/magnetic flux) and the setting input signal, such as 0 to 5 V DC/0 to 10 V DC or 4 to 20 mA DC, entered from outside to set the output frequency (torque/ magnetic flux).

Analog input display unit changing (Pr.241) The analog input display unit (%/V/mA) for analog input bias and gain calibration can be changed.

+ PID control

Process control such as control of the flow rate, air volume or pressure, is possible via the inverter.

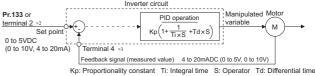

When the parameter unit (FR-PU07) is used, the display unit of parameters and monitored items related to PID control can be changed to various units.

A feedback system can be configured and PID control can be performed using the terminal 2 input signal or parameter setting value as the set point, and the terminal 4 input signal as the feedback value.

• Pr.128 = "10, 11" (deviation value signal input)

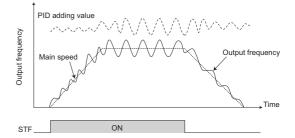

• Pr.128 = "20, 21" (measured value input)

When the second PID function is set, two sets of PID functions can be switched for use. The second PID function is enabled by turning ON the RT signal.

Dancer control

Dancer control is performed by setting "40 to 43" in Pr.128 PID action selection. The main speed command is the speed command for each operation mode (External, PU and communication). PID control is performed by the dancer roll position detection signal, and the control result is added to the main speed command. For the main speed acceleration/ deceleration time, set the acceleration time to Pr.44 Second acceleration/deceleration time and the deceleration time to Pr.45 Second deceleration time.

Commercial power supply-inverter switchover function

V/F Magnetic flux Sensorless Vector

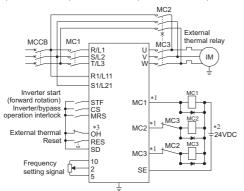

Pr.	GROUP	Name	Pr.	GROUP	Name
135	A000	Electronic bypass sequence selection	136	A001	MC switchover interlock time
137	A002	Start waiting time	138	A003	Bypass selection at a fault
139	A004	Automatic switchover frequency from inverter to bypass operation	159	A005	Automatic switchover frequency range from bypass to inverter operation
57	A702	Restart coasting time	58	A703	Restart cushion time

The inverter contains complicated sequence circuits for switching between the commercial power supply operation and inverter operation. Therefore, interlock operation of the magnetic contactor for switching can be easily performed by simply inputting start, stop, and automatic switching selection signals.

The commercial power supply operation is not available with Mitsubishi Electric vector control dedicated motors (SF-V5RU).

Pr.135 setting	Description
0 (initial value)	Without electronic bypass sequence
1	With electronic bypass sequence

Sink logic, Pr.185 = "7", Pr.192 = "17", Pr.193 = "18", Pr.194 = "19"

Electronic bypass sequence connection diagram (standard model)

- Be careful of the capacity of the sequence output terminals.
 - When connecting a DC power supply, insert a protective diode.
 - The applied terminals differ by the settings of Pr.180 to Pr.189 (input terminal function selection)

Output current detection (Y12 signal) and zero current detection (Y13 signal)

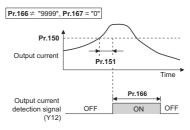

Pr.	GROUP	Name	Pr.	GROUP	Name
150	M460	Output current detection level	151	M461	Output current detection signal delay time
152	M462	Zero current detection level	153	M463	Zero current detection time
166	M433	Output current detection signal retention time	167	M464	Output current detection operation selection

The output current during inverter running can be detected and output to the output terminal.

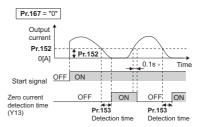

Output current detection

(Y12 signal, Pr.150, Pr.151, Pr.166, Pr.167)

- The output current detection function can be used for purposes such as overtorque detection.
- If the output during inverter running is the Pr.150 setting or higher for the time set in Pr.151 or longer, the output current detection signal (Y12) is output from the inverter's open collector or relay output terminal.

Zero current detection (Y13 signal, Pr.152, Pr.153, Pr.167) If the output during inverter running is the Pr.152 setting or lower for the time set in Pr.153 or longer, the zero current detection signal (Y13) is output from the inverter's open collector or relay output terminal.

stored to the Pr.152 level, the Y13 * When the output is restored to signal is turned OFF after 0.1 s

Output current detection operation selection (Pr.167)

Pr.167 setting	Y12 signal-ON	Y13 signal-ON
0 (initial value)	Continuous operation	Continuous operation
1	E.CDO	Continuous operation
10	Continuous operation	E.CDO
11	E.CDO	E.CDO

Pr. 154 Refer to the page on Pr.22.

Selecting operating conditions of the second function signal (RT) and the third function signal (X9)

Pr.	GROUP	Name
155	T730	RT signal function validity condition selection

The second (third) function can be selected by the RT (X9) signal. Operating conditions (validity conditions) for the second (third) function can also be set.

Pr.155 setting	Description		
0 (initial value)	The second (third) function is immediately enabled with ON of the RT (X9) signal.		
10	The second (third) function will be enabled while the RT signal is ON and while running at a constant speed. (Disabled while accelerating or decelerating)		

· Items that can be set as the second function and third function (When the RT (X9) signal is ON, the following second (third) functions are selected at the same time.)

Function	First function Parameter number	Second function Parameter number	Third function Parameter number
Torque boost	Pr.0	Pr.46	Pr.112
Base frequency	Pr.3	Pr.47	Pr.113
Acceleration time	Pr.7	Pr.44	Pr.110
Deceleration time	Pr.8	Pr.44, Pr.45	Pr.110, Pr.111
Electronic thermal O/L relay	Pr.9	Pr.51	*2
Free thermal	Pr.600 to Pr.604	Pr.692 to Pr.696	*2

Torque control gain	Pr.824, Pr.825	Pr.834, Pr.835	*2
Torque detection filter	Pr.827	Pr.837	*2

- The function can be changed by switching the RT signal ON/OFF while the inverter is stopped. If a signal is switched during operation, the operation method changes after the inverter stops.
- When the RT signal is OFF, the first function is selected and when it is ON, the second function is selected.

Pr. 156, 157 Refer to the page on Pr.22. Refer to the page on Pr.52. Refer to the page on Pr.135.

User group function

Pr.	GROUP	Name	Pr.	GROUP	Name
160	E440	User group read selection	172	E441	User group registered display/ batch clear
173	E442	User group registration	174	E443	User group clear

This function restricts the parameters that are read by the operation panel and parameter unit.

The initial setting displays all parameters.

Pr.160 setting	Description		
0 (initial value)	Displays all parameters.		
1	Displays parameters registered in the user group.		
9999	Displays only the simple mode parameters.		

User group function (Pr.160, Pr.172 to Pr.174)

The user group function is a function for displaying only the parameters required for a setting.

A maximum of 16 parameters from any of the parameters can be registered in a user group. When **Pr.160** = "1", reading/writing is enabled only for the parameters registered in user groups. (Parameters not registered in user groups can no longer be read.) To register a parameter in a user group, set the parameter number in Pr.173.

To clear a parameter from a user group, set the parameter number in Pr.174. To batch clear all the registered parameters, set Pr.172 = "9999".

Operation panel operation selection

Pr.	GROUP	Name	Pr.	GROUP	Name
161	E200	Frequency setting/ key lock operation selection	295	E201	Frequency change increment amount setting

Setting dial potentiometer mode/key lock operation selection (Pr.161)

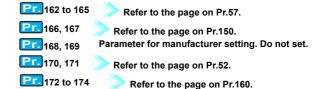

The setting dial of the operation panel (FR-DU08) can be used for setting like a potentiometer.

The key operation of the operation panel can be disabled.

j	Pr.161 setting	Description		
	0 (initial value)	Setting dial frequency setting mode	Key lock mode	
	1	Setting dial potentiometer mode	disabled	
	Setting dial frequency setting mode Key lock mode		Key lock mode	
	11	Setting dial potentiometer mode	enabled	

Frequency change increment amount setting (Pr.295)

When setting a frequency using the setting dial on the operation panel (FR-DU08), the frequency change increment is determined by how quickly the setting dial is rotated.

Input terminal function assignment

		_	

- Be careful when changing the frequency setting with an analog signal or the setting dial of the operation panel (FR-DU08) because this change speed and the timing of the change speed determined by the acceleration/deceleration time setting may cause the output of the SU (up to frequency) signal to switch repeatedly between ON and OFF. (This repeating does not occur when the acceleration/deceleration time setting is "0 s".)
- When the power is reset, the fault output 2 signal (ALM2) turns OFF at the same time as the power turns OFF.
- Available when the option is connected.
- The setting is available only for standard models. The setting is available only for standard models and IP55 compatible models.
- The setting can be used for **Pr.313 to Pr.322** for the FR-A800-GF or when an option (FR-A8AY, FR-A8AR, FR-A8NC, or FR-A8NCE) is installed. For the corresponding parameters of each option, refer to the Instruction Manual of the option. The function is not available in the FR-A842-P.
- The setting is available only in the FR-A842-P. The setting is available only in the FR-A800-E.
- · Adjusting the output terminal response level (Pr.289)

Pr. 289 setting	Description
5 to 50 ms	Set the time delay for the output terminal response.
9999 (initial value)	No output terminal filter.

Cooling fan operation selection

Pr.	GROUP	Name
244	H100	Cooling fan operation selection

A cooling fan is built into the inverter and its operation can be controlled.

Pr.244 setting	Description
0	A cooling fan operates at power ON. Cooling fan ON/OFF control is invalid. (The cooling fan is always ON at power ON)
1 (initial value)	Cooling fan ON/OFF control is valid. The fan is always ON while the inverter is running. During a stop, the inverter status is monitored and the fan switches ON/OFF according to the temperature.
101 to 105	Cooling fan ON/OFF control is valid. Set the cooling fan stop waiting time within 1 to 5 s. The waiting time is the Pr.244 setting minus 100.

Slip compensation

Pr.	GROUP	Name	Pr.	GROUP	Name
245	G203	Rated slip	246	G204	Slip compensation time constant
247	G205	Constant-power range slip compensation selection			

Motor slip is estimated from the inverter output current and the rotation of the motor is maintained as a constant.

Self po	wer man	agement	
V/F	Magnetic flux	PM	

Pr.	GROUP	Name	Pr.	GROUP	Name
248	A006	Self power management selection	254	A007	Main circuit power OFF waiting time
137	A002	Start waiting time	30	E300	Regenerative function selection

By turning ON the magnetic contactor (MC) on the input side before the motor is started and turning OFF the MC after the motor is stopped, supplying power to the main circuit is stopped, reducing the standby power.

Pr.	Setting range	Description		
	0 (initial value)	Self power management function disabled		
248	1	Self power management function enabled (main circuit OFF at protective function activation)		
240	2	Self power management function enabled (main circuit OFF at protective function activation due to a circuit failure)		
137	0 to 100 s	Set a time period that is a little longer than the time period from the ON signal input to the actual pick-up operation of MC1 (0.3 to 0.5 s).		
	1 to 3600 s	Set the waiting time until the main circuit power supply is turned OFF after the motor is stopped.		
254	9999	The main circuit power supply is turned OFF only when the protective function selected by Pr.248 is activated.		

Pr.	Setting range	Description
30	100, 101	Power supply to the inverter: AC (terminals R, S, and T) When power is supplied only to the control circuit, and then switched to be supplied to both the control and main circuits, inverter reset is not performed.
	0 to 2, 10, 11, 20, 21, 102, 110, 111, 120, 121	For other settings, refer to page 123.

Earth (ground) fault detection at start Magnetic flux

Pr.	GROUP	Name
249	H101	Earth (ground) fault detection at start

Select whether to enable/disable earth (ground) fault detection at start. When enabled, earth (ground) fault detection is performed immediately after a start signal is input to the inverter.

Pr.249 setting	Description
0 (initial value)	Without the earth (ground) fault detection at start
1	With the earth (ground) fault detection at start

If a ground fault is detected at start while Pr.249 = "1", the output side earth (ground) fault overcurrent (E.GF) is displayed and the outputs are shut off.

Motor stop method/start signal selection

Pr.	GROUP	Name
250	G106	Stop selection

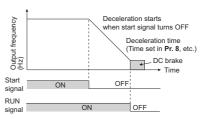

Select the stopping method (deceleration stop or coasting) at turn-OFF of the start signal.

Use this function to stop a motor with a mechanical brake at turn-OFF of the start signal.

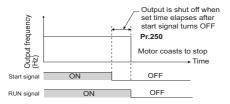

The start signal (STF/STR) operation can also be selected.

Pr.250	Description			
Setting	Start signal (STF/STR)	Stop operation		
0 to 100 s	STF signal: Forward rotation start STR signal: Reverse rotation start	It will coast to stop after set time when the start signal is turned OFF.		
1000 s to 1100 s	STF signal: Start signal STR signal: Forward/ reverse rotation signal	It will coast to stop after (Pr.250 - 1000) s when the start signal is turned OFF.		
9999	STF signal: Forward rotation start STR signal: Reverse rotation start	It will perform deceleration stop when the start signal is		
8888	STF signal: Start signal STR signal: Forward/ reverse rotation signal	turned OFF.		

When Pr.250 is "9999 (initial value) or 8888"

When Pr.250 is other than "9999 (initial value) or 8888"

I/O phase loss protection selection

Pr.	GROUP	Name	Pr.	GROUP	Name
251	H200	Output phase loss protection selection	872	H201	Input phase loss protection selection

The output phase loss protective function, which stops the inverter output if one of the three phases (U, V, W) on the inverter's output side (load side) is lost, can be disabled.

The input phase loss protective function on the inverter's input side (R, S, T) can be enabled.

Pr.	Setting range	Description
251	0	Without output phase loss protection
	1 (initial value)	With output phase loss protection
872	0 (initial value)	Without input phase loss protection
	1	With input phase loss protection

Pr. 252, 253 Refer to the page on Pr.73.

Displaying the life of the inverter parts

Pr.	GROUP	Name	Pr.	GROUP	Name
255	E700	Life alarm status display	256	E701	Inrush current limit circuit life display
257	E702	Control circuit capacitor life display	258	E703	Main circuit capacitor life display
259	E704	Main circuit capacitor life measuring	506	E705	Display estimated main circuit capacitor residual life

The degree of deterioration of the main circuit capacitor, control circuit capacitor, inrush current limit circuit, cooling fan, and internal fan alarm*2 can be diagnosed on the monitor.

When a part approaches the end of its life, an alarm can be output by self diagnosis to prevent a fault.

(Note that the life diagnosis of this function should be used as a guideline only, because with the exception of the main circuit capacitor, the life values are theoretical calculations.)

Pr.	Setting range	Description		
255	(0 to 15, 32 to 47) *1	Displays whether or not the parts of the control circuit capacitor, main circuit capacitor, cooling fan, Internal fan alarm*2, and inrush current limit circuit have reached the life alarm output level. Read-only.		
256 *3	(0 to 100%)	Displays the deterioration degree of the inrush current limit circuit. Read-only.		
257 *3	(0 to 100%)	Displays the deterioration degree of the control circuit capacitor. Read-only.		
258 *3	(0 to 100%)	Displays the deterioration degree of the main circuit capacitor. Read-only. The value measured by Pr.259 is displayed.		
259 *3	0, 1 (2, 3, 8, 9)	Setting "1" and turning the power supply OFF starts the measurement of the main circuit capacitor life. If the setting value of Pr.259 becomes "3" after turning the power supply ON again, it means that the measurement is completed. The deterioration degree is read to Pr.258.		
506 *3	(0 to 100%)	Displays the estimated residual life of the main circuit capacitor. Read-only.		

- The setting range (reading only) for separated converter types is "0, 1, 4, or 5". The setting range (reading only) for IP55 compatible models is "0 to 63".
- The internal fan is only available for the IP55 compatible model.
- The setting is available only for standard models and IP55 compatible models.

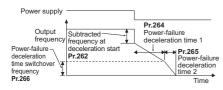

Power failure time deceleration stop function

Pr.	GROUP	Name	Pr.	GROUP	Name
261	A730	Power failure stop selection	262	A731	Subtracted frequency at deceleration start
263	A732	Subtraction starting frequency	264	A733	Power-failure deceleration time 1
265	A734	Power-failure deceleration time 2	266	A735	Power failure deceleration time switchover frequency
294	A785	UV avoidance voltage gain	606	T722	Power failure stop external signal input selection
668	T786	Power failure stop frequency gain			

At instantaneous power failure or undervoltage, the motor can be decelerated to a stop or decelerated once and re-accelerated to the set frequency.

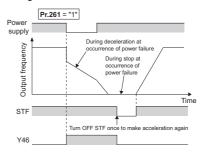

Pr.	Setting range	Description		
	0 (initial value)	Power failure time deceleration stop function disabled		
261	1, 2, 11, 12, 21, 22	Power failure time deceleration stop function enabled Select action at an undervoltage or when a power failure occurs.		
262	0 to 20Hz	Normally, the motor runs at the initial value as it is. However, adjust to suit the size of the load specification (moment of inertia, torque).		
263	0 to 590 Hz	When output frequency ≥ Pr.263 Deceleration from (output frequency - Pr.262) When output frequency < Pr.263 Deceleration from output frequency		
	9999	Deceleration from (output frequency - Pr.262)		
264	0 to 3600 s	Set the slope applicable from the deceleration start to the Pr.266 set frequency.		
265	0 to 3600 s	Set the slope applicable for the frequency range starting at Pr.266 and downward.		
	9999 (initial value)	Same as Pr.264 .		
266	0 to 590 Hz	Set the frequency at which the slope during deceleration switches from the Pr.264 setting to the Pr.265 setting.		
294	0 to 200%	Adjust the response level at UV avoidance operation. Setting a large value improves the response to changes in the bus voltage. If the inertia is high, the amount of regeneration is too large. Set a smaller value.		
606	0	Normally open input (NO contact input specification)		
000	1 (initial value)	Normally closed input (NC contact input specification)		
668	0 to 200%	Adjust the response level for the operation where the deceleration time is automatically adjusted.		

 Set Pr.261 to select the action at an undervoltage and power failure.

Pr.261 setting	Action at undervoltage and power failure	Power restoration during deceleration at occurrence of power failure	Deceleration stop time	Undervoltage avoidance function
0	Coasts to stop	Coasts to stop	-	-
1		Deceleration stop		Not used
2		Re-acceleration	According to Pr.262 to Pr.266 setting	Not used
11		Deceleration stop		With
12	Deceleration	Re-acceleration		With
21	stop	Deceleration stop	Automatic adjustment of deceleration time	Not used
22		Re-acceleration		Not used

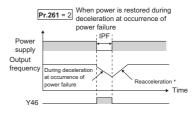

Power failure stop function (Pr.261 = "1, 11, 21")
 Even if power is restored during deceleration triggered by a power failure, deceleration stop is continued after which the inverter stays stopped. To restart operation, turn the start signal OFF then ON again.

 Continuous operation function at instantaneous power failure (Pr.261 = "2, 12, 22")

The motor re-accelerates to the set frequency if the power restores during deceleration at occurrence of power failure. Combining with the automatic restart after instantaneous power failure function enables a power failure time deceleration stop and re-acceleration at a power restoration.

If the power is restored after stoppage by a power failure, a restart operation is performed when automatic restart after instantaneous power failure (**Pr.57** ≠ "9999") is selected.

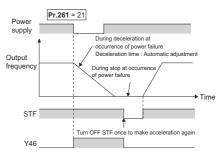

* Acceleration time depends on Pr.7 (Pr.44

 Automatic adjustment of deceleration time (Pr.261 = "21, 22" Pr.294, Pr.668)

When "21, 22" is set in **Pr.261**, the deceleration time is automatically adjusted to keep (DC bus) voltage constant in the converter when the motor decelerates to a stop at a power failure. Setting of **Pr.262** to **Pr.266** is not required.

Use Pr.668 Power failure stop frequency gain to adjust the response level during deceleration time auto adjustment. Increasing the setting improves the response level to the bus voltage fluctuations, but the output frequency may be unstable. If setting Pr.294 UV avoidance voltage gain lower also does not suppress the vibration, set Pr.668 lower.

Load torque high-speed frequency control

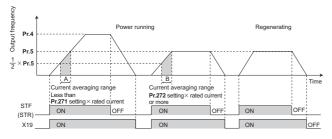

Pr.	GROUP	Name	Pr.	GROUP	Name
270	A200	Stop-on contact/load torque high-speed frequency control selection	271	A201	High-speed setting maximum current
272	A202	Middle-speed setting minimum current	273	A203	Current averaging range
274	A204	Current averaging filter time constant	4	D301	Multi-speed setting (high speed)
5	D302	Multi-speed setting (middle speed)			

This function is designed to increase speed automatically under light load, for example to minimize the incoming/outgoing time in a multistory parking lot.

The load size during power driving is estimated by detecting average currents at set timings after a start. When the load is light, the frequency is increased from the originally-set frequency. (During regeneration load operation, the frequency is not increased.)

Pr.270 setting	Description		
0 (initial value)	Normal operation		
1	Stop-on-contact control		
2	Load torque high-speed frequency control		
3	Stop-on-contact + load torque high-speed frequency control		
11	Stop-on-contact control	E.OLT detection invalid	
13	Stop-on-contact + load torque high-speed frequency control	under stop-on contact control	

- Set such items as the current and averaging range for load torque high-speed frequency control selected by setting Pr.270 = "2 or 3"
- When the load torque high-speed frequency selection (X19) signal is ON, the inverter automatically adjusts the maximum frequency in the range between the Pr.4 Multi-speed setting (high speed) and Pr.5 Multi-speed setting (middle speed) setting in accordance with the average current while the motor is accelerating from a frequency that is half of the Pr.5 setting to the Pr.5 setting as shown in the figure below.

Pr.	Setting range	Description			
4	0 to 590 Hz	Set the higher-speed frequency.			
5	0 to 590 Hz	Set the lower-speed frequency.			
271	0 to 400%	Set the upper and lower limits of the current at			
272	0 to 400%	high and middle speeds.			
273	0 to 590 Hz	Set the average current during acceleration from (Pr.273 × 1/2) Hz to (Pr.273) Hz.			
2/3	9999 (Initialization)	Set the average current during acceleration from ($\text{Pr.5} \times 1/2$) Hz to (Pr.5) Hz.			
274	1 to 4000	Set the time constant of the primary delay filter relative to the output current. (The time constant [ms] is $0.5 \times Pr.274$, and the initial value is 8 ms.) A larger setting results in a stable operation with poorer response.			

Stop-on-contact control Magnetic flux

Pr.	GROUP	Name	Pr.	GROUP	Name
270	A200	Stop-on contact/load torque high-speed frequency control selection	275	A205	Stop-on contact excitation current low-speed multiplying factor
276	A206	PWM carrier frequency at stop-on contact	22	H500	Stall prevention operation level
6	D303	Multi-speed setting (low speed)	48	H600	Second stall prevention operation level

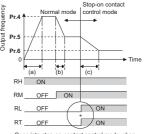

To ensure accurate positioning at the upper limit, etc. of a lift, stopon-contact control causes the mechanical brake to close while the motor creates a holding torque to keep the load in contact with a mechanical stopper, etc.

This function suppresses vibration that is likely to occur when the load is stopped upon contact in lift applications, thereby ensuring reliable and highly accurate positioning stop.

Pr.270 setting	Description		
0 (initial value)	Normal operation		
1	Stop-on-contact control		
2	Load torque high-speed frequency control		
3	Stop-on-contact + load torque high-speed frequency control		
11	Stop-on-contact control	E OLT involid	
13	Stop-on-contact + load torque high-speed frequency control	E.OLT invalid under stop-on- contact control	

Select either Real sensorless vector control (speed control) or Advanced magnetic flux vector control. When both the RT and RL signals are switched ON, the inverter enters the stop-oncontact control, and operation is performed at the frequency

set in Pr.6 Multi-speed setting (low speed) independently of the preceding speed.

- Goes into stop-on-contact control mode who both RL and RT switch on. RL and RT may be switched on in any order with any time difference
- (a): Acceleration time(Pr.7) (b): Deceleration time(Pr.8) (c): Second deceleration tir

Pr. Setting range		Description		
6	0 to 590 Hz	Set the output frequency for stop-on-contact control. Set the frequency as low as possible (about 2 Hz). If a frequency higher than 30 Hz is set, it operates with 30 Hz. When performing stop-on-contact control during encoder feedback control, encoder feedback control is invalid due to a transition to the stop-on-contact control mode.		
22	0 to 400%	Set the stall prevention operation level for stop-on- contact control used under Advanced magnetic flux vector control.		
48	0 to 400%	The smaller value set in either Pr.22 or Pr.48 has priority. The torque limit level uses the Pr.22 setting for Real sensorless vector control.		
275	0 to 300%	Normally set this parameter within the range of 130% to 180%. Set the force (holding torque) for stop-on-contact control.		
	9999 (initial value)	No compensation.		

Pr. Setting range		Description			
	0 to 9*1	Set a PWM carrier frequency for stop-on-contact			
276 *3	0 to 4*2	control. For Real sensorless vector control, the carrier frequency is always 2 kHz when the setting value is 6 to 9. (Valid at the output frequency of 3 Hz or less.)			
	9999 (initial value)	As set in Pr.72 PWM frequency selection.			

- The setting range of FR-A820-03160(55K) or lower and FR-A840-01800(55K) or lower

648	A128	Second deceleration detection function selection	650	A128	Second brake opening current selection
651	A129	Second brake operation frequency selection			

This function outputs operation timing signals of the mechanical brake from the inverter, such as for lift applications.

This function is useful in preventing load slippage at a start due to poor mechanical brake timing and overcurrent alarm in stop status and enable secure operation.

<Operation example>

At start

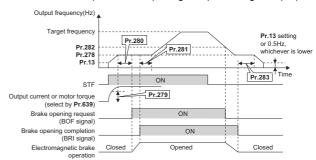

When the start signal is input to the inverter, the inverter starts running, and when the output frequency reaches the frequency set in Pr.278 and the output current or the motor torque is equal to or greater than the Pr.279 setting, the brake opening request signal (BOF) is output after the time set in Pr.280. The brake opening completion signal (BRI) is input, and the output frequency is increased to the set speed after the set time in Pr.281.

Deceleration time

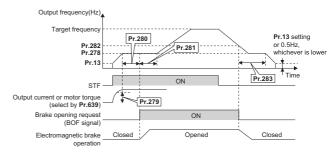

When the inverter decelerates to the frequency set in Pr.282, the inverter turns OFF the BOF signal and decelerates further to the frequency set in Pr.278. After electromagnetic brake operation completes and the inverter recognizes the turn OFF of the BRI signal, the inverter holds the frequency set in Pr.283 for the time set in Pr.283. And after the time set in Pr.283 passes, the inverter decelerates again. *1 The inverter outputs is shut off when the frequency reaches Pr.13 Starting frequency setting or 0.5 Hz, whichever is lower.

When Pr.292 = "8" (without mechanical brake opening completion signal input), the time starts when the brake opening completion signal is output.

When Pr.292 = "7" (with brake opening completion signal input)

When Pr.292 = "8" (without brake opening completion signal input)

Turning ON the RT signal enables the second brake sequence function.

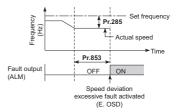

Pr.	Setting range	Description		
278	0 to 30Hz	Set the rated slip frequency of the motor + approx. 1.0 Hz. This can be set only when Pr.278 ≤ Pr.282 .		
279 0 to 400%		If the setting is too low, dropping of the load is more likely to occur at a start, and generally, it is set between 50 and 90%. The inverter rated current is regarded as 100%.		
280	0 to 2 s	Generally set between 0.1 and 0.3 s.		
281	0 to 5 s	Pr.292 = 7: Set the mechanical delay time until braking eases. Pr.292 = 8: Set the mechanical delay time until braking eases + approx. 0.1 to 0.2 s.		
282	0 to 30Hz	Frequency that turns OFF the brake opening request signal (BOF) and operates the electromagnetic brake. Generally, set the setting value of Pr.278 + 3 to 4 Hz. This can be set only when Pr.282 ≥ Pr.278 .		
283	0 to 5 s	Pr.292 = 7: Set the mechanical delay time until the brake closes + 0.1 s. Pr.292 = 8: Set the mechanical delay time until the brake closes + approx. 0.2 to 0.3 s.		
	0 (initial value)	The deceleration detection function disabled.		
284	1	The protective function activates when the deceleration speed of the deceleration operation is not normal.		
285 *2	0 to 30Hz	The brake sequence fault (E.MB1) activates when the difference between the detection frequency and output frequency is equal to or greater than the setting value under encoder feedback control.		
	9999 (initial value)	Overspeed detection disabled.		
292	0, 1, 3, 5 to 8, 11	Setting this parameter to "7, 8" enables the brake sequence function.		
639	0 (initial value)	Brake opening by output current		
	1	Brake opening by motor torque		
640	0 (initial value)	Brake closing operation by frequency command		
040	1	Brake closing operation by the actual motor rotation speed (estimated value)		
	0 (initial value)	Normal operation when the RT signal is ON		
641	7	Second brake sequence 1 when the RT signal is ON		
	8	Second brake sequence 2 when the RT signal is ON		
	9999	First brake sequence 1 is valid when the RT signal is ON		

The speed deviation excess detection frequency is used when vector control is performed.

Avoiding motor overrunning Vector

Pr.	GROUP	Name	Pr.	GROUP	Name
285	H416	Speed deviation excess detection frequency	853	H417	Speed deviation time
873	H415	Speed limit			

· Speed deviation excess detection (Pr.285, Pr.853) When the difference (absolute value) between the speed command value and actual rotation speed in speed control under vector control is equal to or higher than the setting value in Pr.285 Speed deviation excess detection frequency for a continuous time equal to or longer than the setting value in Pr.853 Speed deviation time, Speed deviation excess detection (E.OSD) activates to shut off the inverter output.

gain torque This is a function to give droop characteristics to the speed by balancing the load in proportion with the load torque. This is effective when balancing the load when using multiple inverters.

Pr.	Setting range	Description		
286	0 (initial value)	Droop control disabled		
200	0.1 to 100%	Set the droop amount at the rated torque as % value of the rated motor frequency.		
287	0 to 1 s	Set the filter time constant to apply to the current for torque.		

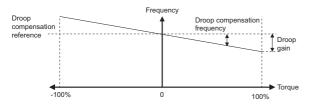

Pr.	Setting range	Descr	iption	
	0 (initial value)	Without droop control during acceleration/ deceleration (With 0 limit)	The Decod catting is the	
	1*1	Constantly droop control during operation (With 0 limit)	The Pr.84 setting is the droop compensation reference.	
	2*1	Constantly droop control during operation (Without 0 limit)		
288	10*1	Without droop control during acceleration/ deceleration (With 0 limit)	Motor speed is the droop compensation reference.	
	11*1	Constantly droop control during operation (With 0 limit)	compensation reference.	
	20*1	Without droop control during acceleration/ deceleration (With 0 limit)		
	21*1	Constantly droop control during operation (With 0 limit)	The Pr.1121 setting is the droop compensation reference.	
	22*1	Constantly droop control during operation (Without 0 limit)		
994	0.1 to 100%	Set the droop amount to be the rated motor frequency.		
554	9999 (initial value)	No function		
995	0.1 to 100%	Set the torque when the d changed.	roop amount is to be	

- Under Advanced magnetic flux vector control, the operation is the same with setting the parameter to "0"

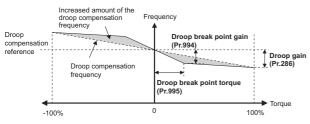

Droop control is enabled for Advanced magnetic flux vector control, Real sensorless vector control, vector control, and PM sensorless vector control when Pr.286 is not "0".

The upper limit of the droop compensation frequency is 120 Hz.

Turning ON the RT signal enables the second droop control.

Break point setting for droop control (Pr.994, Pr.995) Set Pr.994 and Pr.995 to have a break point on a droop compensation frequency line. Setting a break point allows the inverter to raise the droop compensation frequency for light-load (no load) operation without raising it for heavy-load operation.

Pulse train input/output

Pr.	GROUP	Name	Pr.	GROUP	Name
291	D100	Pulse train I/O selection	384	D101	Input pulse division scaling factor
385	D110	Frequency for zero input pulse	386	D111	Frequency for maximum input pulse

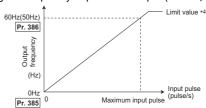

A pulse train input to terminal JOG can be used to set the inverter's speed command.

The pulse train can be output from terminal FM by the open collector output system.

Speed synchronized operation of an inverter can be performed by using the pulse train input/output together with terminal JOG.

Pr.291 setting	Input (Terminal JOG)	Output (Terminal FM)
0 (initial value)	JOG signal *2	FM output *3
1	Pulse train input	FM output *3
10 *3	JOG signal *2	Pulse train output (50% duty)
11 *3	Pulse train input	Pulse train output (50% duty)
20 *3	JOG signal *2	Pulse train output (ON width
21 *3		fixed)
100 *3	Pulse train input	Pulse train output (ON width fixed) *1

- Regardless of the Pr.54 setting, the signal input as a pulse train is output as it is
- *2 The function is assigned in Pr.185 JOG terminal function
- Only the FM type inverters support the pulse train output. *3
- · Changing the frequency at pulse train input (Pr.385, Pr.386)

- Limit value = (Pr.386 Pr.385) 1.1 + Pr.385
- How to calculate the input pulse division scaling factor (Pr.384) Maximum number of pulses (pulse/s) = $Pr.384 \times 400$ (Allowable maximum number of pulses = 100k pulses/s)
- If Pr.419 Position command source selection = "2" (simple pulse train position command) is set, terminal JOG is used for the simple position pulse train input regardless of the Pr.291 Pulse train I/O selection setting.

Password function

Pr.	GROUP	Name	Pr.	GROUP	Name
296	E410	Password lock level	297	E411	Password lock/ unlock

Registering a 4-digit password can restrict parameter reading/ writing.

Level of reading/writing restriction by PU/NET mode operation command can be selected by Pr.296.

The inverter can adjust the stop position (Orientation control) using an encoder attached to a place such as the main shaft of the machine.

An orientation control compatible option is required.

- Internal stop position command When "0" is set in Pr.350 Stop position command selection, the internal position command mode is activated. In the internal position command mode, the setting value of Pr.356 Internal stop position command is used as the stop position.
- Internal stop position command When Pr.350 Stop position command selection is set to "1" and the FR-A8AX is used, 16-bit data (binary input) is used to give the stop position.
- Operation timing chart

Using the FR-A8TP (motor end) together with the plug-in option FR-A8AP/FR-A8AL/FR-A8APR (machine end) enables machine end orientation control.

Setting **Pr.862** = "1" enables machine end orientation. When only the FR-A8AL is used, machine end orientation control is enabled by setting the number of machine end encoder pulses in Pr.829.

Encoder feedback control

Magnetic flux

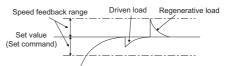

Pr.	GROUP	Name	Pr.	GROUP	Name
359	C141	Encoder rotation direction	367	G240	Speed feedback range
368	G241	Feedback gain	369	C140	Number of encoder pulses
144	M002	Speed setting switchover	285	A107	Overspeed detection frequency
851	C240	Control terminal option-Number of encoder pulses	852	C241	Control terminal option-Encoder rotation direction

By detecting the rotation speed of the motor with the encoder and feeding it back to the inverter, output frequency of the inverter is controlled to keep the speed of the motor constant even for the load change.

A vector control compatible option is required.

- · Using Pr.359 Encoder rotation direction and Pr.369 Number of encoder pulses, set the rotation direction and the number of pulses for the encoder.
- When a value other than "9999" is set in Pr.367 Speed feedback range, encoder feedback control is valid.

Using the set point (frequency at which stable speed operation is performed) as reference, set the higher and lower setting range. Normally, set the frequency converted from the slip amount (r/ min) of the rated motor speed (rated load). If the setting is too large, response becomes slow.

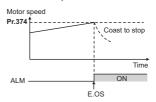

· Set Pr.368 Feedback gain when the rotation is unstable or response is slow.

Pr.368 setting	Description
Pr.368 > 1	Response will become faster but it may cause overcurrent or become unstable.
1 > Pr.368	Response will become slower but it will become more stable.

Motor overspeeding detection

If the motor rotation speed exceeds the speed set in Pr.374 during encoder feedback control, Real sensorless vector control, vector control or PM sensorless vector control, Overspeed occurrence (E.OS) occurs, the inverter output is shut off.

Signal loss detection of encoder signals Magnetic flux Vector

Pr.	GROUP	Name	Pr.	GROUP	Name
376	C148	Encoder signal loss detection enable/ disable selection	855	C240	Control terminal option-Signal loss detection enable/ disable selection

If encoder signals are disconnected during encoder feedback control, orientation control or vector control, Signal loss detection (E.ECT) is turned ON to shut off the inverter output.

	1	Auto storage fund	tion enabled			
675	9999 (initial value)	Auto storage fund	tion disabled			

Pr.	Setting range	Description
1150 to 1199	0 to 65535	Desired values can be set. Because devices D206 to D255 used by the PLC function can be mutually accessed, the values set to Pr.1150 to Pr.1199 can be used by the sequence program. The result of performing calculation by a sequence program can also be monitored by Pr.1150 to Pr.1199.

- Switch the execution key (RUN/STOP) of the sequence program by turning the SQ signal ON/OFF. The sequence program can be executed by turning the SQ signal ON. To input the SQ signal, set "50" in any of Pr.178 to Pr.189 (input terminal function selection) to assign the function to a terminal.
- To write to the sequence program, use FR Configurator2 on a personal computer that is connected to the inverter via RS-485 communication.
- This function copies the PLC function project data to a USB memory device.

The PLC function project data copied in the USB memory device can be copied to other inverters. This function is useful in backing up the parameter setting and for allowing multiple inverters to operate by the same sequence programs.

1292	B190	Position control terminal input selection	1293	B191	Roll feeding mode selection

Set positioning parameters such as the number of pulses (position) and acceleration/deceleration time in advance to create a point table (point table method). Positioning operation is performed by selecting the point table.

• Positioning operation by point tables, example 1 (automatic continuous positioning operation)
The figure below shows an operation example when the following settings are made for point tables.

Point table	Target position		Maximum Acceleration time		Deceleration time	Dwell time	Auxiliary function
lable	Upper	Lower	(Hz)	(s)	(s)	(ms)	Turiction
1	100	0	60	5	5	1000	1 (absolute position, continuous)
2	50	0	30	6	6	0	10 (increment al position, individual)

• Selecting the home position return method (Pr.1282 to Pr.1288)

Pr.1282	Home position	Description
Setting	return method	•
0	Dog type *1 Vector	Deceleration starts when the proximity dog signal is turned ON. For the home position after turn OFF of the proximity dog signal, the position specified by the first Z-phase signal or the position of the first Z-phase signal shifted by the home position shift amount (Pr.1285 , Pr.1286) is used.
1	Count type *1	Deceleration starts when the proximity dog signal is turned ON. After the proximity dog, the motor travels the specified travel distance (Pr.1287, Pr.1288). Then, it uses the position specified by the first Z-phase signal or position of the Z-phase signal shifted by the home position shift amount (Pr.1285, Pr.1286).
2	Data set type Vector	The position at which the start signal is input is used as the home position.
3	Stopper type Vector	A workpiece is pressed to a mechanical stopper, and the position where it is stopped is set as the home position. Pressing is confirmed when the estimated speed value has fallen blow Pr.865 Low speed detection for 0.5 s during activation of the torque limit operation. (While the stopper-type home position is performed, Pr.1289 Home position return stopper torque is applied.) After Pr.1290 Home position return stopper waiting time has passed after pressing is confirmed, the home position is shifted by the home position shift amount (Pr.1285 and Pr.1286). After a position command is created and the absolute value of the droop pulse (after electronic gear) falls below the in-position width, the home position return is completed.
4 (initial value)	Ignoring the home position (Servo ON position as the home position) Vector	The serve ON position is used as the home position.
5	Dog type back end reference Vector	Deceleration starts at the front end of the proximity dog. After the back end is passed, the position is shifted by the post-dog travel distance and home position shift amount. The position after the shifts is set as the home position. Set pulses required for deceleration from the creep speed or more as the total of the postdog travel distance and home position shift amount.
6	Count type front end reference Vector	Deceleration starts at the front end of the proximity dog, and the position is shifted by the postdog travel distance and home position shift distance. The position after the shifts is set as the home position. Set pulses required for changing the speed from the home position speed to the creep speed or more as the total of the post-dog travel distance and home position shift amount.

If it is set under PM sensorless vector control, Home position return parameter setting error (HP3) occurs.

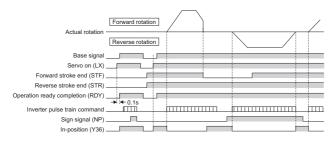

Position control by pulse train input Vector PM

- Timing to clear the current position 2 monitor value differs depending on the setting value.

 During position control under Vector control, if **Pr.419** = "1" while
- the FR-A8AL is not installed (or is disabled), the protective function (E.OPT) is activated.
- The home position return is not available.
- During position control under Vector control, if **Pr.419** = "1110 or 1310" while the FR-A8APS is not installed (or is disabled), a protective function (E.OPT) is activated.
- Select the command pulse train with Pr.428.
- If the Pre-excitation/servo ON (LX) signal is turned ON, output shutoff is canceled and the Position control preparation ready (RDY) signal is turned ON after 0.1 s. Turning ON STF (forward rotation stroke end signal) or STR (reverse rotation stroke end signal) rotates the motor according to the command pulse. If the forward (reverse) rotation stroke end signal is turned OFF, the motor does not rotate in the corresponding direction.

Electronic gear setting under position control Vector PM

Pr.	GROUP	Name	Pr.	GROUP	Name
420	B001	Command pulse scaling factor numerator (electronic gear numerator)	421	B002	Command pulse multiplication denominator (electronic gear denominator)
424	B005	Position command acceleration/ deceleration time constant			

Set the gear ratio between the machine gear and motor gear.

Pr.	Setting range	Description
420		Set the electronic gear.
421	0 to 32767	Pr.420 is the numerator and Pr.421 is the denominator.
424	0 to 50 s	Use it when the rotation is not smooth because the electronic gear ratio is large (10 times or larger) and the rotation speed is slow.

Position control gain adjustment

Vector PM

Pr.	GROUP	Name	Pr.	GROUP	Name
422	B003	Position control gain	423	B004	Position feed forward gain
425	B006	Position feed forward command filter	446	B012	Model position control gain
1298	B013	Second position control gain			

- Adjust Pr.422 when any of such phenomena as unusual vibration, noise and overcurrent of the motor/machine occurs. Increasing the setting improves traceability for the position command and also improves servo rigidity at a stop, but oppositely makes an overshoot and vibration more liable to occur.
- The function of **Pr.423** is to cancel a delay caused by the droop pulses in the deviation counter.
- The first delay filter for the feed forward command can be input in Pr.425.
- Use Pr.446 to set the gain for the model position controller.
- Turning ON the RT signal enables the second position loop gain.

688	E714	Maintenance timer 3	689	E715	Maintenance timer 3 warning output set time

The maintenance timer output signal (Y95) is output when the inverter's cumulative energization time reaches the time period set with the parameter. MT1, MT2 or MT3 is displayed on the operation panel (FR-DU08).

This can be used as a guideline for the maintenance time of peripheral devices.

Operation example of the maintenance timer 1 (Pr.503, Pr.504) (with both MT2 and MT3 OFF)

 The cumulative energization time of the inverter is stored in the EEPROM every hour and displayed in Pr.503 (Pr.686, Pr.688) in 100 h increments. Pr.503 (Pr.686, Pr.688) is clamped at 9998 (999800 h).

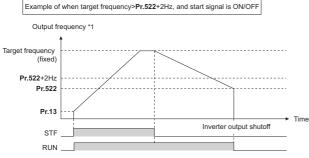

Output stop function

Pr.	GROUP	Name
522	G105	Output stop frequency

The motor coasts to a stop (inverter output shutoff) when inverter output frequency falls to **Pr. 522** setting or lower.

Pr.522 setting	Description			
0 to 590 Hz	Set the frequency to start coasting to a stop (output shutoff).			
9999 (initial value)	No function			

 When both of the frequency setting signal and output frequency falls to the frequency set in Pr.522 or lower, the inverter stops the output and the motor coasts to a stop.

- *1 The output frequency before the slip compensation is compared with the **Pr.522** setting.
- At a stop condition, the motor starts running when the frequency setting signal exceeds Pr.522 +2Hz. The motor is accelerated at the Pr.13 Starting frequency (0.01Hz under IPM motor control) at the start.

USB device communication

Pr.	GROUP	Name	Pr.	GROUP	Name
547	N040	USB communication station number	548	N041	USB communication check time interval

Setup of the inverter can be easily performed with FR Configurator2 through the USB communication.

Pr.	Setting range	Description		
547	547 0 to 31 Inverter station number specification			
	0	USB communication is possible, however the inverter will trip (E.USB) when the mode changes to the PU operation mode.		
548	0.1 to 999.8	Set the communication check time interval. If a no-communication state persists for longer than the permissible time, the inverter will trip (E.USB).		
	9999 (initial value)	No communication check

Current average value monitor signal

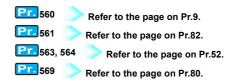

Pr.	GROUP	Name	Pr.	GROUP	Name
555	E720	Current average time	556	E721	Data output mask time
557	E722	Current average value monitor signal output reference current			

The output current average value during constant-speed operation and the maintenance timer value are output to the current average value monitor signal (Y93) as a pulse.

The output pulse width can be used in a device such as the I/O module of a programmable controller as a guideline for the maintenance time for mechanical wear, belt stretching, or deterioration of devices with age.

The pulse is repeatedly output during constant-speed operation in cycles of 20 s to the Current average monitor signal (Y93).

Multiple rating setting

Pr.	GROUP	Name
570	E301	Multiple rating setting

Four rating types of different rated current and permissible load can be selected. The optimal inverter rating can be chosen in accordance with the application, enabling equipment size to be reduced.

Pr.570 setting	Description
0 *1	SLD rating 110% 60 s, 120% 3 s (inverse-time characteristics) Surrounding air temperature of 40°C
1	LD rating 120% 60 s, 150% 3 s (inverse-time characteristics) Surrounding air temperature of 50°C
2 (initial value)	ND rating 150% 60 s, 200% 3 s (inverse-time characteristics) Surrounding air temperature of 50°C
3 *1	HD rating 200% 60 s, 250% 3 s (inverse-time characteristics) Surrounding air temperature of 50°C

*1 Not compatible with the IP55 compatible model.

Parallel operation communication check time (FR-A842-P)

If the communication between the master and the slave is lost for a certain period, the inverter assumes it is in disconnection state and activates the protective function (E.SER) to shut off the output.

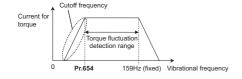

Pr. 652 setting	Description
0	Parallel operation communication disabled
0.1 to 120 s	Set the interval of the communication check (signal loss detection) time. If a no-communication state persists for the permissible time or longer, the inverter will trip.
9999	No communication check (signal loss detection)

Speed smoothing control

Pr.	GROUP	Name	Pr.	GROUP	Name
653	G410	Speed smoothing control	654	G411	Speed smoothing cutoff frequency

The vibration (resonance) of the machine during motor operation can be suppressed.

- Set Pr.653 to 100%, and check if the vibration is suppressed. If the vibration is not suppressed, raise the setting value of Pr.653 gradually to minimize the vibration.
- When the vibrational frequency due to the mechanical resonance (fluctuation of torque, speed, and converter output voltage) is known using a tester and such, set 1/2 to 1 times of the vibrational frequency to Pr.654. (Setting vibrational frequency range can suppress the vibration better.)

Analog remote output function

An analog value can be output from the analog output terminal.

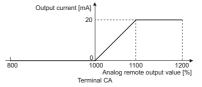

Pr. 655 setting	Description		
0 (initial value)	Remote output data is cleared when the power supply is turned OFF.	Remote output data is cleared during an inverter reset.	
1	Remote output data is retained when the power supply is turned OFF.		
10	Remote output data is cleared when the power supply is turned OFF.	the power supply is turned Remote output data is	
11	Remote output data is retained when the power supply is turned DFF.		

Terminals FM/CA, AM and the analog output terminal of the option FR-A8AY can output the values set in Pr.656 to Pr.659 (Analog remote output).

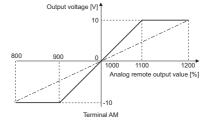

When Pr.54 FM/CA terminal function selection = "87, 88, 89, or 90" (remote output), the FM type inverter can output a pulse train from terminal FM.

When Pr.54 FM/CA terminal function selection = "87, 88, 89, or 90" (remote output), the CA type inverter can output any analog current from terminal CA.

When Pr.158 AM terminal function selection = "87, 88, 89, or 90", an analog voltage can be output from terminal AM.

Increased magnetic excitation deceleration

Magnetic flux Sensorless Vector

Pr.	GROUP	Name	Pr.	GROUP	Name
660	G130	Increased magnetic excitation deceleration operation selection	661	G131	Magnetic excitation increase rate
662	G132	Increased magnetic excitation current level			

Increase the loss in the motor by increasing the magnetic flux at the time of deceleration. Deceleration time can be reduced by suppressing the stall prevention (overvoltage) (oL).

It will make possible to reduce the deceleration time without a brake resistor. (Usage can be reduced if a brake resistor is used.)

Pr.	Setting range	Description	
660 (initial value)		Without increased magnetic excitation deceleration	
	1	With increased magnetic excitation deceleration	
	0 to 40%	Set the increase of magnetic excitation.	
661	9999 (initial value)	Magnetic excitation increase rate 10% under V/F control and Advanced magnetic flux vector control	
		Magnetic excitation increase rate 0% under Real sensorless vector control and vector control	
662	0 to 300%	The increased magnetic excitation rate is	

Setting of increased magnetic excitation rate (Pr.660, Pr.661) When the DC bus voltage exceeds the increased magnetic excitation deceleration operation level during the deceleration, excitation is increased in accordance with the setting value in Pr.661.

Inverter	Increased magnetic excitation deceleration operation level
200 V class	340 V
400 V class	680 V
With 500 V input	740 V

Surrounding air temperature change monitoring

Pr.	GROUP	Name
663	M060	Control circuit temperature signal output level

Turn ON/OFF the control circuit temperature signal (Y207) according to the result of comparison between the Pr.663 setting and the monitored value of the control circuit temperature.

SF-PR slip amount adjustment mode

Pr.	GROUP	Name	Pr.	GROUP	Name
673	G060	SF-PR slip amount adjustment operation selection	674	G061	SF-PR slip amount adjustment gain

As compared to our conventional SF-JR motor, the slip amount is small for the high-performance energy-saving SF-PR motor. When replacing the SF-JR to the SF-PR, the slip amount is reduced and the rotations per minute increases. Therefore, when the SF-PR is used with the same frequency setting as that of the SF-JR, power consumption may increase as compared to the SF-JR. By setting the slip amount adjustment mode, the frequency command can be adjusted to keep the rotations per minute of the SF-PR equivalent to those of the SF-JR for power consumption

reduction. (This function is not available on the FR-A842-P.)

Pr.	Setting range	Description
	2, 4, 6	Set the number of SF-PR motor poles.
673	9999 (initial value)	Slip amount adjustment mode invalid
674	0 to 500%	Setting is available for fine adjustment of the slip amount. To reduce the rotations per minute, set a larger value. To increase the rotations per minute, set a smaller value.

Pr. 686 to 689	Refer to the page on Pr.503.

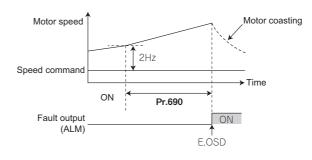

Deceleration check Vector

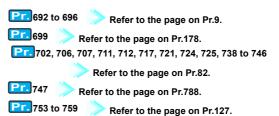

Pr.	GROUP	Name
690	H881	Deceleration check time

This function can stop the inverter output when the motor is accelerated accidentally during operation.

This prevents a malfunction due to incorrect encoder pulse settings.

Pr. 690 setting	Description
0 to 3600 s	Set the time required to shut off output due to deceleration check after the start signal is OFF.
9999	No deceleration check

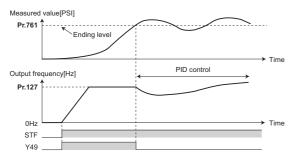

PID pre-charge function

Pr.	GROUP	Name	Pr.	GROUP	Name
760	A616	Pre-charge fault selection	761	A617	Pre-charge ending level
762	A618	Pre-charge ending time	763	A619	Pre-charge upper detection level
764	A620	Pre-charge time limit	765	A656	Second pre-charge fault selection
766	A657	Second pre-charge ending level	767	A658	Second pre-charge ending time
768	A659	Second pre-charge upper detection level	769	A660	Second pre-charge time limit

This function is to drive the motor at a certain speed before starting PID control. This function is useful for a pump with a long hose. Without this function, PID control would start before the pump is filled with water, and proper control would not be performed.

Pr.	Setting range	Description
760	0 (initial value)	Fault indication with output shutoff immediately after a pre-charge fault occurs.
700	1	Fault indication with deceleration stop after a pre-charge fault occurs.
761	0 to 100%	Set the measurement level to end the pre- charge operation.
101	9999 (initial value)	Without pre-charge ending level
762	0 to 3600 s	Set the time to end the pre-charge operation.
702	9999 (initial value)	Without pre-charge ending time
763	0 to 100%	Set the upper limit for the pre-charged amount. A pre-charge fault occurs when the measured value exceeds the setting during pre-charging.
	9999 (initial value)	Without pre-charge upper limit level
764	0 to 3600 s	Set the time limit for the pre-charge operation. A pre-charge fault occurs when the pre-charge time exceeds the setting.
	9999 (initial value)	Without pre-charge time limit

Example of pre-charge operation When the measured amount reaches the pre-charge ending level (Pr.761 Pre-charge ending level ≠ "9999")The pre-charge operation ends when the measured value reaches the Pr.761 setting or higher, then the PID control is performed

· Turning ON the RT signal enables the second pre-charge function.

774 to 776 Refer to the page on Pr.52. Refer to the page on Pr.117.

Low-speed range torque characteristics selection PM

(Pr.	GROUP	Name	Pr.	GROUP	Name
7	788	G250	Low speed range torque characteristic selection	747	G350	Second motor low- speed range torque characteristic selection

The torque characteristics in a low-speed range under PM sensorless vector control can be changed. (This function is not available on the FR-A842-P.)

Pr.	Setting range	Description
788	0	Disables the low-speed range torque characteristic (current synchronization operation).
700	9999 (initial value) *1	Enables the low-speed range torque characteristic (high frequency superposition control)
747	0	Disables the low-speed range torque characteristic (current synchronization operation) while the RT signal is ON.
747	9999 (initial value) *1	Enables the low-speed range torque characteristic (high frequency superposition control) while the RT signal is ON.

- The low-speed range high-torque characteristic (current synchronization operation) is disabled for PM motors other than MM-CF, even if "9999" is set.
- · Use Pr.747 to switch the torque characteristic according to the application or to switch among motors connected to one inverter.

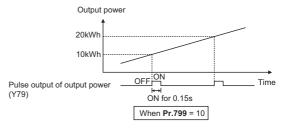

Pulse train output of output power (Y79 signal)

Pr.	GROUP	Name
799	M520	Pulse increment setting for output power

After power ON or inverter reset, output signal (Y79 signal) is output in pulses every time accumulated output power, which is counted after the Pr.799 Pulse increment setting for output power is set, reaches the specified value (or its integral multiples).

Pr. 799 setting	Description
	Pulse train output of output power (Y79) is output in pulses at every output power (kWh) that is specified.

- The inverter continues to count the output power at retry function or when automatic restart after instantaneous power failure function works without power OFF of output power (power failure that is too short to cause an inverter reset), and it does not reset the count.
- If power failure occurs, output power is counted from 0 kWh again.
- Assign pulse output of output power (Y79: setting value 79 (positive logic), 179 (negative logic)) to any of Pr.190 to Pr.196 (Output terminal function selection).

Easy gain tuning selection Sensorless Vector PM

The load inertia ratio (load moment of inertia) for the motor is calculated in real time from the torque command and rotation speed during motor driving by the vector control. Gains for each control (**Pr.422**, **Pr.820**, **Pr.821**, **and Pr.828**) are set automatically from this load inertia ratio and the setting value for the response level (**Pr.818**). Under Real sensorless vector control or PM sensorless vector control, enter the load inertia ratio manually.

The work required for gain adjustment is reduced.

- Set the response level in Pr.818 to calculate each gain from the load inertia ratio.
- The Pr.819 setting enables/disables the easy gain tuning.

Pr.	Setting range	Description
818	1 to 15	1: Slow response ↓ 15: Fast response
	0 (initial value)	No easy gain tuning
		Gain is calculated with load calculation. (This function is valid under vector control.)
	2	Gain is calculated with load (Pr.880) manual input.

Proportional gain setting for speed loop

Sensorless Vector PM

Pr.	GROUP	Name	Pr.	GROUP	Name
820	G211	Speed control P gain 1	830	G311	Speed control P gain 2
1116	G206	Constant output range speed control P gain compensation	1117	G261	Speed control P gain 1 (per-unit system)
1118	G361	Speed control P gain 2 (per-unit system)	1121	G260	Per-unit speed control reference frequency

Set the proportional gain for speed loop. (Setting this parameter higher improves the speed response and reduces the speed fluctuation caused by external disturbance. However, too large setting causes vibration or noise.)

- The setting range of Pr.820 Speed control P gain 1 and Pr.830 Speed control P gain 2 is 0 to 1000%. The initial value of Pr.820 is 60%.
- A speed loop proportional gain can be set in the per-unit system using Pr.1117, Pr.1118, and Pr.1121.
- As the speed control response level is decreased in the constant output range (at the rated speed or more) due to the weak field magnet, the speed control P gain is compensated in Pr.1116.

Integral time setting for speed control Sensorless Vector PM

Pr.	GROUP	Name	Pr.	GROUP	Name
821	G212	Speed control integral time 1	831	G312	Speed control integral time 2
1115	G218	Speed control integral term clear time	1348	G263	P/PI control switchover frequency

Set the integral compensation time for speed loop.

Setting this parameter lower shortens the return time to the original speed when the speed fluctuates due to external disturbance. However, too small setting causes overshoot.

Setting this parameter higher improves the level of safety. However, large setting prolongs the return time (response time) and may cause undershoot.

When the X44 signal is turned ON or the motor speed falls below the **Pr.1348** setting, speed loop integration is stopped and the accumulated integral term is reduced and cleared according to **Pr.1115**.

Speed detection filter function

Sensorless Vector PM

Pr.	GROUP	Name	Pr.	GROUP	Name
823	G215	Speed detection filter 1	833	G315	Speed detection filter 2

Set the time constant of primary delay filter for speed feedback signal.

Speed loop response is reduced. Under ordinary circumstances, therefore, use the initial value as it is.

If there is speed ripple due to high frequency disturbance, set a time constant.

Speed is oppositely destabilized if the setting value is too large.

Proportional gain setting for current loop Sensorless Vector PM

Pr.	GROUP	Name	Pr.	GROUP	Name
824	G213	Torque control P gain 1 (current loop proportional gain)	834	G313	Torque control P gain 2

Set the proportional gain under torque control.

If the setting value is large, changes in the current command can be followed well and current fluctuation relative to external disturbance is smaller. If the setting value is however too large, it becomes unstable and high frequency torque pulse is produced.

The setting range of Pr.824 Torque control P gain 1 (current loop proportional gain) and Pr.834 Torque control P gain 2 is 0 to 500%. The initial value of Pr.824 is 100%.

For ordinary adjustment, try to set within the range of 50 to 200%.

Current control integral time setting

Sensorless Vector

Pr.	GROUP	Name	Pr.	GROUP	Name
825	G214	Torque control integral time 1 (current loop integral time)	835	G314	Torque control integral time 2

Set the current loop integral compensation time under torque control.

Setting this parameter smaller increases torque response. However, too small setting may destabilize current.

If the setting value is small, it produces current fluctuation toward disturbance, decreasing time until it returns to the original current value

Pr. 826 Refer to the page on Pr.74.

Torque detection filter function

Sensorless Vector PM

Pr.	GROUP	Name	Pr.	GROUP	Name
827	G216	Torque detection filter 1	837	G316	Torque detection filter 2

Set the time constant of primary delay filter for torque feedback signal.

Current loop response is reduced. Under ordinary circumstances, therefore, use the initial value as it is.

Refer to the page on Pr.74.

Speed feed forward control and model adaptive speed control

Sensorless Vector PM

Pr.	GROUP	Name	Pr.	GROUP	Name
828	G224	Model speed control gain	877	G220	Speed feed forward control/model adaptive speed control selection
878	G221	Speed feed forward filter	879	G222	Speed feed forward torque limit
880	C114	Load inertia ratio	881	G223	Speed feed forward gain
1119	G262	Model speed control gain (per-unit system)	1121	G260	Per-unit speed control reference frequency

Speed feed forward control or model adaptive speed control can be selected using parameter settings.

Under speed feed forward control, the motor trackability for speed command changes can be improved.

Under model adaptive speed control, the speed trackability and the response level to motor external disturbance torque can be adjusted individually.

Pr. 877 setting	Description
0 (initial value)	Perform normal speed control.
1	Perform speed feed forward control.
2	Model adaptive speed control becomes valid.

Speed feed forward control

When the load inertia ratio is set in Pr.880, the required torque for the set inertia is calculated according to the acceleration and deceleration commands, and the torque is generated quickly. When the inertia ratio is to be estimated by easy gain tuning, the estimated inertia ratio is stored as the setting value of Pr.880. The speed feed forward is calculated based on this setting value. When the speed feed forward gain is 100%, the calculation result for speed feed forward is applied as is.

If the speed command changes suddenly, the torque is increased by the speed feed forward calculation. The maximum limit for the speed feed forward torque is set in Pr.879.

The speed feed forward result can also be lessened with a primary delay filter in Pr.878.

Model adaptive speed control

The model speed of the motor is calculated, and the feedback is applied to the speed controller on the model side. Also, this model speed is set as the command of the actual speed controller. The inertia ratio of Pr.880 is used when the speed controller on the model side calculates the torque current command value. When the inertia ratio is to be estimated by easy gain tuning, the setting value of Pr.880 is overwritten by the estimated inertia ratio. The torque current command value is calculated based on this setting value. The torque current command of the speed controller on the model side is added to the output of the actual speed controller, and set as the input of the iq current control.

Pr.828 is used for the speed control on the model side (P control), and first gain Pr.820 is used for the actual speed controller. The model adaptive speed control is enabled for the first motor. Even if the driven motor is switched to the second motor while Pr.877 = "2", the second motor is operated as Pr.877 = "0".

The model adaptive speed control gain can be set in the per-unit system using Pr.1119 and Pr.1121.

Torque bias Sensorless Vector

Pr.	GROUP	Name	Pr.	GROUP	Name
840	G230	Torque bias selection	841	G231	Torque bias 1
842	G232	Torque bias 2	843	G233	Torque bias 3
844	G234	Torque bias filter	845	G235	Torque bias operation time
846	G236	Torque bias balance compensation	847	G237	Fall-time torque bias terminal 1 bias
848	G238	Fall-time torque bias terminal 1 gain			

The torque bias function can be used to make the starting torque start-up faster. At this time, the motor starting torque can be adjusted with a contact signal or analog signal.

Pr. 840 setting	Description
0	Set the torque bias amount using contact signals (X42, X43) in Pr.841 to Pr.843 .
1	Set the torque bias amount using terminal 1 in any of C16 to C19. (When the squirrel cage rises during forward motor rotation.)
2	Set the torque bias amount using terminal 1 in any of C16 to C19. (When the squirrel cage rises during reverse motor rotation.)
3	The torque bias amount using terminal 1 can be set automatically in C16 to C19 and Pr.846 according to the load.
24	For details of the torque bias command via PROFIBUS
25	communication (FR-A8NP), refer to the Instruction Manual of the FR-A8NP (option).
9999 (initial value)	No torque bias, rated torque 100%

• Pr.841 Torque bias 1, Pr.842 Torque bias 2, and Pr.843 Torque

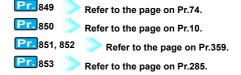

The rated torque of 100% equals to the torque bias setting value of 1000%, which is the central value of the torque. When the setting value is 1000%, the bias value is "0".

Pr.844 Torque bias filter

The torque start-up can be made slower. The torque start-up operation at this time is the time constant of the primary delay filter.

- Pr.845 Torque bias operation time Set the time for continuing the output torque simply by using the command value for the torque bias.
- Pr.846 Torque bias balance compensation Set the voltage of the torque bias analog input value that is input to terminal 1 to compensate the balance of the torque bias amount.
- Pr.847 Fall-time torque bias terminal 1 bias, Pr.848 Fall-time torque bias terminal 1 gain

Set the torque bias amount of when the cage is descended.

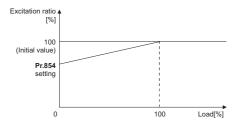

Excitation ratio Sensorless Vector

The excitation ratio can be lowered to enhance efficiency for light loads. (Motor magnetic noise can be reduced.)

When excitation ratio is reduced, output torque startup is less responsive.

Pr. 855 Refer to the page on Pr.376.

-: No function

Encoder pulse dividing output Vector

Pr.	GROUP	Name	Pr.	GROUP	Name
413	M601	Encoder pulse division ratio	863	M600	Control terminal option-Encoder pulse division ratio

When the FR-A8AL or FR-A8TP is used, the encoder pulse at the motor end can be divided in division ratio set in Pr.413 (for the FR-A8AL) or Pr.863 (for the FR-A8TP) for the signal output.

Use this parameter to make the response of the machine to be input slower, etc.

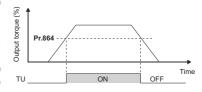

Pr.	GROUP	Name
864	M470	Torque detection

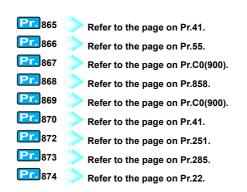

A signal is output when the motor torque is higher than the setting of Pr.864.

This function can be used for electromagnetic brake operation, open signal, etc.

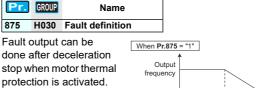

The Torque detection (TU) signal turns ON when the output torque reaches the detection torque value set in Pr.864 or higher.

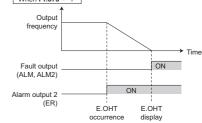

The Torque detection (TU) signal turns OFF when the output torque drops lower than the detection torque value.

Fault definition

Pr.875 setting	Operation	Description
0 (initial value)	Normal operation	The output of the inverter is shut off immediately if any fault occurs. At this time, the alarm output 2 signal (ER) and a fault signal are output.
1	Fault definition	At activation of the external thermal relay (E.OHT), motor load (electronic thermal O/L relay) (E.THM) and PTC thermistor (PTC) protective functions, the alarm output 2 (ER) signallis is displayed, and the motor decelerates to stop. After it stops, a fault signal is output. During fault occurrence aside from the E.OHT, E.THM and E.PTC, the output is immediately shut off, and the fault is outputted. Under position control, the operation of the setting value "0" is applied.

Regeneration avoidance function

Pr.	GROUP	Name	Pr.	GROUP	Name
882	G120	Regeneration avoidance operation selection	883	G121	Regeneration avoidance operation level
884	G122	Regeneration avoidance at deceleration detection sensitivity	885	G123	Regeneration avoidance compensation frequency limit value
886	G124	Regeneration avoidance voltage gain	665	G125	Regeneration avoidance frequency gain

The regenerative status can be avoided by detecting the regenerative status and raising the frequency.

· Continuous operation is possible by increasing the frequency automatically so it will not go into regenerative operation even when the fan is turned forcefully by other fans in the same duct.

Pr.	Setting range	Description		
	0 (initial value)	Disables regeneration avoidance function		
882	1	Constantly enables regeneration avoidance function		
	2	Enables regeneration avoidance function only during constant-speed operation		
883	300 to 1200 V	Set the bus voltage level to operate the regeneration avoidance operation. When the bus voltage level is set low, it will be harder to generate overvoltage error, but actual deceleration time will be longer. Set the setting value higher than power supply		
		voltage $\times \sqrt{2}$.		
	0 (initial value)	Disables regeneration avoidance due to bus voltage change rate		
884	1 to 5	Set the sensitivity to detect the bus voltage change rate. Setting value 1		
885	0 to 590 Hz	Set the limit value for frequency to rise when the regeneration avoidance function operates.		
	9999	Disables frequency limit		
886	0 to 200%	Adjust the response at the time of regeneration avoidance operation. When the setting value is set larger, response against the bus voltage change will improve, but the output frequency		
665	0 to 200%	may become unstable. If the load inertia of the motor is large, set the setting value of Pr.886 smaller. When the vibration cannot be stabilized even if the setting value of Pr.886 is made smaller, set the setting value of Pr.665 smaller.		

Free parameter

Pr.	GROUP	Name	Pr.	GROUP	Name
888	E420	Free parameter 1	889	E421	Free parameter 2

These parameters can be used for any purpose.

Any number within the setting range of 0 to 9999 can be input. For example, these numbers can be used:

- · As a unit number when multiple units are used.
- As a pattern number for each operation application when multiple units are used.
- · As the year and month of introduction or inspection.

Energy saving monitor

Adjusting terminal FM/CA and terminal AM (calibration)

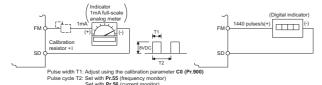

Pr.	GROUP	Name	Pr.	GROUP	Name
C0 (900)	M310	FM terminal calibration	C1 (901)	M320	AM terminal calibration
C8 (930)	M330	Current output bias signal	C9 (930)	M331	Current output bias current
C10 (931)	M332	Current output gain signal	C11 (931)	M333	Current output gain current
867	M321	AM output filter	869	M334	Current output filter

By using the operation panel or parameter unit, terminals FM, CA and AM can be calibrated to the full scale.

Terminal FM calibration (C0 (Pr.900))

Terminal FM is preset to output pulses. By setting the calibration parameter C0 (Pr.900), the meter connected to the inverter can be calibrated by parameter setting without use of a calibration

Using the pulse train output of terminal FM, a digital display can be provided to connect a digital counter. The monitor value is 1440 pulses/s output at the full-scale value of Pr.54 FM/CA terminal function selection.

Not needed when the operation panel (FR-DU08) or parameter unit (FR-PU07) is used for calibration.

Use a calibration resistor when the indicator (frequency meter) needs to be calibrated by a neighboring device because the indicator is located far from the inverter.

However, the frequency meter needle may not deflect to full-scale if the calibration resistor is connected. In this case, calibrate additionally with the operation panel or parameter unit

Calibration with Pr.900 cannot be done when terminal FM is set to open collector output with Pr.291 Pulse train I/O selection.

- Calibration of terminal AM (C1 (Pr.901)) Terminal AM is initially set to provide a 10 VDC output in the fullscale state of the corresponding monitor item. Calibration parameter C1 (Pr.901) allows the output voltage ratio (gains) to be adjusted according to the meter scale. Note that the maximum output voltage is 10 VDC.
- Using Pr.867, the output voltage response of terminal AM can be adjusted in the range of 0 to 5 s
- Terminal CA calibration (C0 (Pr.900), C8 (Pr.930) to C11 (Pr.931)) Terminal CA is initially set to provide a 20 mADC output in the fullscale state of the corresponding monitor item. Calibration parameter C0 (Pr.900) allows the output current ratio (gains) to be adjusted according to the meter scale. Note that the maximum output current is 20 mA DC.

- · Set a value at the minimum current output in the calibration parameters C8 (Pr.930) and C9 (Pr.930). Calibration parameter C10 (Pr.931) and C11 (Pr.931) are used to set a value at the maximum current output.
- Using Pr.869, the output current response of terminal CA can be adjusted in the range of 0 to 5 s.

Simple clock function

Pr.	GROUP	Name	Pr.	GROUP	Name
1006	E020	Clock (year)	1007	E021	Clock (month, day)
1008	E022	Clock (hour, minute)			

The time can be set. The time can only be updated while the inverter power is ON.

Pr.	Description	
1006	Set the year (A.D.). Initial value: 2000	
1007	Set the month and day. 1000 and 100 digits: January to December 10 and 1 digits: 1 to end of month (28, 29, 30 or 31) For December 31, set "1231". Initial value: 101 (January 1)	
1008	Set the hour and minute using the 24-hour clock. 1000 and 100 digits: 0 to 23 hours	

- · When the year, month, day, time and minute are set in the parameters, the inverter counts the date and time. The date and time can be checked by reading the parameters.
- Because the date and time are cleared after turning OFF the control circuit power supply, the clock function must be reset after turning ON the power supply. Use a separate power supply, such as an external 24 V power supply, for the control circuit of the simple clock function, and supply power continuously to this control circuit.

By using the real-time clock function with the FR-LU08, it is not necessary to set the time again even when the power supply is turned OFF.

The set clock is also used for functions such as fault history.

Pr. 1018

Emergency stop function

Pr.	GROUP	Name	P	GROUP	Name
1103	F040	Deceleration time at emergency stop	1349	G264	Emergency stop operation selection

At a failure in the host controller, the motor can be decelerated to a stop using an input via an external terminal.

At turn-ON of the emergency stop signal (X92), the motor is decelerated in the deceleration time of Pr.1103 in accordance with the torque limit set in Pr.815.

The droop control and the speed loop integration at the emergency stop by the Emergency stop (X92) signal can be enabled/disabled using Pr.1349.

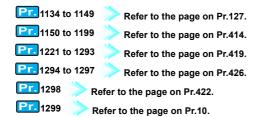

Inverter-to-inverter link function (FR-A800-E)

The inverter-to-inverter link function enables communication between multiple inverters connected by Ethernet in a small-scale system by using the I/O devices and special registers of the PLC function. The inverter-to-inverter link function is enabled by simply setting **Pr.1124** and **Pr.1125**.

Pr.	Setting range	Description
1124	0 to 5	Set the station number for the inverter-to-inverter link function.
1124	9999 (initial value)	Inverter-to-inverter link function disabled
1125	2 to 6	Set the total number of inverters used for the inverter-to-inverter link function.

- · Setting procedure
- 1. Set a value other than "0" in **Pr.414 PLC function operation** selection to enable the PLC function.
- To set the inverter as the master, set "0" in **Pr.1124**, and to set the inverter as a slave, select a station number from 1 to 5 and set the number in **Pr.1124**.
- Set the total number of inverters used for the inverter-to-inverter link function in **Pr.1125**.
- For example, set "3" in **Pr.1125** when two slave inverters and the master inverter are used.
- 4. Use FR Configurator2 to write sequence programs to the master inverter.

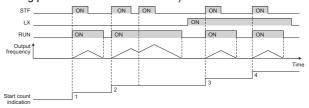

Start count monitor

Pr.	GROUP	Name	Pr.	GROUP	Name
1410	A170	Starting times lower 4 digits	1411	A171	Starting times upper 4 digits

- The inverter starting times can be counted.
- Confirming the starting times can be used to determine the timing of the maintenance, or can be used as a reference for system inspection or parts replacement.

Pr.	Pr. Setting range Descrip	
1410	0 to 9999	Displays the lower four digits of the number of the inverter starting times.
1411	1411 0 to 9999 Displays the upper four digits of the inverter starting times.	

 Every start signal input (the RUN signal ON) while the inverter output is stopped is counted as the inverter starting time. (Starting during pre-excitation is also counted.)

Pr. 1412, 1413 Refer to the page on Pr.82.

Load characteristics fault detection

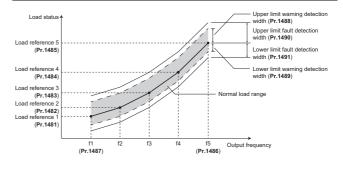

Pr.	GROUP	Name	Pr.	GROUP	Name
1480	H520	Load characteristics measurement mode	1481	H521	Load characteristics load reference 1
1482	H522	Load characteristics load reference 2	1483	H523	Load characteristics load reference 3
1484	H524	Load characteristics load reference 4	1485	H525	Load characteristics load reference 5
1486	H526	Load characteristics maximum frequency	1487	H527	Load characteristics minimum frequency
1488	H531	Upper limit warning detection width	1489	H532	Lower limit warning detection width
1490	H533	Upper limit fault detection width	1491	H534	Lower limit fault detection width
1492	H535	Load status detection signal delay time / load reference measurement waiting time			

This function is used to monitor whether the load is operating in normal condition by storing the speed/torque relationship in the inverter to detect mechanical faults or for maintenance. When the load operating condition deviates from the normal range, the protective function is activated or the warning is output to protect the inverter or the motor.

(This function is not available in the FR-A842-P.)

Pr.	Setting range	Description		
4400	0 (initial value)	Load characteristics measurement mode does not start. (Measurement of load characteristics complete without fault.)		
1480	1	Load characteristics measurement mode is started.		
	2, 3, 4, 5, 81, 82, 83, 84, 85	The load characteristics measurement status is displayed. (Read-only)		
1481		Set the reference value of normal load		
1482		characteristics.		
1483	0 to 400%	8888: The present load status is written as		
1484		reference status.		
1485		9999: The load reference is invalid.		

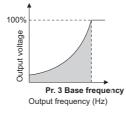

Pr.	Setting range	Description
1486	0 to 590 Hz	Set the maximum frequency of the load characteristics fault detection range.
1487	0 to 590 Hz	Set the minimum frequency of the load characteristics fault detection range.
1488	0 to 400%	Set the detection width when the upper limit load fault warning is output.
	9999	Function disabled
1489	0 to 400%	Set the detection width when the lower limit load fault warning is output.
	9999	Function disabled
1490	0 to 400%	Set the detection width when output is shut off when the upper limit load fault occurs.
1430	9999 (initial value)	Function disabled
1491	0 to 400%	Set the detection width when output is shut off when the lower limit load fault occurs.
1431	9999 (initial value)	Function disabled
1492	0 to 60 s	Set the waiting time after the load fault is detected until warning output or output shutoff. In the load characteristics measurement mode, set the waiting time after the load measurement frequency is reached until the load reference is set.

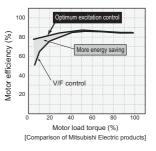

To perform energy-saving operation for an application such as a fan or pump

To perform energy-saving operation for an application such as a fan or pump, set the parameters as follows.

- Load pattern selection (Pr.14) Optimal output characteristics (V/F characteristics) can be selected for application or load characteristics.
 - Set "1" (for variable-torque load) in Pr.14 Load pattern selection.
 - The output voltage will change in square curve against the output frequency at the base frequency or lower.
 - Set this parameter when driving a load with load torque change proportionally against the square of the rotation speed, such as a fan or pump.

- Energy saving control (Pr.60) Inverter will perform energy saving control automatically even when the detailed parameter settings are made. It is appropriate for an application such as a fan or pump.
 - · Set Pr.60 Energy saving control selection = "9" (Optimum excitation control mode).
 - The Optimum excitation control is a control method to decide the output voltage by controlling the excitation current so the efficiency of the motor is maximized.
 - The energy saving effect cannot be expected when the motor capacity is extremely smaller than the inverter capacity, or when multiple motors are connected to one inverter.

Protective Functions

• The list of inverter protective functions

When the inverter detects a fault, depending on the nature of the fault, the operation panel displays an error message or warning, or a protective function is activated to trip the inverter.

	Name	Description	Operation panel indication	
	Fault history	The operation panel stores the fault indications which appears when a protective function is activated to display the fault record for the past eight faults.	E	
*2	Operation panel lock	Appears when operation was tried during operation panel lock.	HOLd	
sage	Password locked	Appears when a password restricted parameter is read/written.	F004	
Error message	Parameter write error	Appears when an error occurred during parameter writing.	Er 16Er4 Er8	
ш	Copy operation error	Appears when an error occurred during parameter copying.	rE ItorEA	
	Error	Appears when the RES signal is on or the PU and inverter can not make normal communication.	Err.	
	Stall prevention (overcurrent)	Appears during overcurrent stall prevention.	۵L	
	Stall prevention (overvoltage)	Appears during overvoltage stall prevention. Appears while the regeneration avoidance function is activated.	οL	
	Regenerative brake pre- alarm *8	Appears if the regenerative brake duty reaches or exceeds 85% of the Pr.70 Special regenerative brake duty value. If the regenerative brake duty reaches 100%, a regenerative overvoltage (E. OV[]) occurs. (Standard models only)	Rb	
	Electronic thermal relay function pre-alarm	Appears when the electronic thermal O/L relay has reached 85% of the specified value.	[
	PU stop	Appears if STOP is pressed in an operation mode other than the PU operation mode.	PS	
	Speed limit indication (output during speed limit)	Appears if the speed limit level is exceeded during torque control.	5L	
3	Continuous operation during communication fault	Appears when the operation continues while an error is occurring in the communication line or communication option (when Pr.502 = "4").	CF.	
Warning *3	Parameter copy	Appears when parameter copy is performed between inverters FR-A820-03160(55K) or lower, FR-A840-01800(55K) or lower, FR-A820-03800(75K) or higher and FR-A840-02160(75K) or higher	[P	
Varn	Safety stop	Appears when safety stop function is activated (during output shutoff).	58	
	Maintenance signal output 1 to 3 *8	Appears when the inverter's cumulative energization time reaches or exceeds the parameter set value.	HI ItoMI IM	
	USB host error	Appears when an excessive current flows into the USB A connector.	∐F	
	Home position return error	Appears when an error occurs during the home position return operation under position control. (HP3 is not available on the FR-A842-P.)	HP 16HP3	
	24 V external power supply operation	Blinks when the main circuit power supply is off and the 24 V external power supply is being input.	Εľ	
	Load fault warning *8	Appears when the load is deviated from the upper or lower limit of the warning detection range. (This function is not available in the FR-A842-P.)	LdF	
	Ethernet communication fault	Appears when Ethernet communication is interrupted by physical factors. (This function is intended for the FR-A800-E only.)	EHR	
	Duplicate IP address	Appears when a duplicate IP address is detected.(This function is intended for the FR-A800-GN only.)	dl P	
	IP address fault	Appears when the rotary switches are set to "0 or 255" and the value set for IP address or subnet mask is out of range. (This function is intended for the FR-A800-GN only.)	1 P	
Alarm *4	Fan alarm	Appears when the cooling fan remains stopped when operation is required or when the speed has decreased.	FN	
Alar	Internal fan alarm	Appears when the internal fan fails, or at a reference replacement time. (IP55 compatible models only)	FNZ	
	Overcurrent trip during acceleration	Appears when an overcurrent occurred during acceleration.	E. 0C I	
	Overcurrent trip during constant speed	Appears when an overcurrent occurred during constant speed operation.	E. 002	
	Overcurrent trip during deceleration or stop	Appears when an overcurrent occurred during deceleration and at a stop.	E. 003	
	Overcurrent trip	The output from a slave inverter in parallel operation is shut off if the input current exceeds the specified level. (This function is intended for the FR-A842-P only.)	E. 007	
	Regenerative overvoltage trip during acceleration	Appears when an overvoltage occurred during acceleration.	E. OV I	
	Regenerative overvoltage trip during constant speed	Appears when an overvoltage occurred during constant speed operation.	E. 0/2	
lt *5	Regenerative overvoltage trip during deceleration or stop	Appears when an overvoltage occurred during deceleration and at a stop.	E. 013	
Fault	Overvoltage trip	If the DC voltage at the main circuit in a slave inverter in parallel operation reaches or exceeds the specified value, the protective circuit is activated to stop the inverter output. The circuit may also be activated by a surge voltage produced in the power supply system. (This function is intended for the FR-A842-P only.)	E. OKT	
	Inverter overload trip (electronic thermal relay function) *1	Appears when the electronic thermal relay function for inverter element protection was activated.	E. THT	
	Motor overload trip (electronic thermal relay function) *!	Appears when the electronic thermal relay function for motor protection was activated.	E. FHM	
	Heat sink overheat	Appears when the heat sink overheated.	E. FIN	
	Instantaneous power failure	Appears when an instantaneous power failure occurred at an input power supply. (Standard models and IP55 compatible models only)	E. I PF	

		Description	Operation panel indication
	Undervoltage	Appears when the main circuit DC voltage became low. (Standard models and IP55 compatible models only)	E. UYF
	Input phase loss *8	Appears if one of the three phases on the inverter input side opened. (Standard models and IP55 compatible models only)	E. I LF
	Stall prevention stop	Appears 3 s after the output frequency is reduced to the reference value by the stall prevention (torque limit) operation.	E. OLF
	Loss of synchronism detection	The inverter trips when the motor operation is not synchronized. This function is only available under PM sensorless vector control. (This function is not available in the FR-A842-P.)	E. 50f
	Upper limit fault detection	Appears when the load exceeds the upper limit of the fault detection range. (This function is not available in the FR-A842-P.)	E. LUP
	Lower limit fault detection	Appears when the load falls below the lower limit of the fault detection range. (This function is not available in the FR-A842-P.)	E. Lan
	Brake transistor alarm detection	The inverter trips if an alarm occurs in the brake circuit, e.g. damaged brake transistors. In this case, the inverter must be powered off immediately. (Appears when an internal circuit fault occurred for separated converter types and IP55 compatible models. This function is not available in the FR-A842-P.)	Е. ЬЕ
	Output side earth (ground) fault overcurrent	Appears when an earth (ground) fault occurred on the Inverter's output side.	E. 6F
	Output phase loss	Appears if one of the three phases on the inverter output side opened.	E. LF
	External thermal relay operation *6	Appears when the external thermal relay connected to terminal OH is activated.	E. OHF
	PTC thermistor operation	The inverter trips if resistance of the PTC thermistor connected between terminal 2 and terminal 10 has reached the Pr.561 PTC thermistor protection level setting or higher.	E. PCC
	Option fault	Appears when torque command by the plug-in option is selected using Pr.804 and no plug-in option is mounted, or if the AC power supply is accidentally connected to terminal R/L1, S/L2, or T/L3 while Pr.30 = "2" to connect a high power factor converter, multifunction regeneration converter, or power regeneration common converter.	E. 0PC
	Communication option fault	Appears when a communication line error occurs in the communication option.	E. OP 16 E. OP3
	Parallel operation slave 1 fault Parallel operation slave 2 fault	Appears on the master inverter when a fault occurs in the slave inverter during the parallel operation. Appears on the master inverter even when the RS-485 terminals are incorrectly connected. (This function is intended for the FR-A842-P only.)	E. PA I E. PA2
	Parameter storage device fault (control board)	Appears when operation of the element where parameters stored became abnormal.	E. PE
lt *5	PU disconnection	Appears when a communication error between the PU and inverter occurred, the communication interval exceeded the permissible time during the RS-485 communication with the PU connecter, or communication errors exceeded the number of retries during the RS-485 communication.	E. PUE
Fault	Retry count excess *8	Appears when the operation was not restarted within the set number of retries. (This function is not available in the FR-A842-P.)	E. REF
	Parameter storage device fault (main circuit board)	Appears when operation of the element where parameters stored became abnormal.	E. PE2
	CPU fault	Appears during the CPU and peripheral circuit errors occurred.	E. CPU E. 5° E. 7
	Operation panel power supply short circuit/RS- 485 terminals power supply short circuit	Appears when the RS-485 terminal power supply or operation panel power supply was shorted.	е. сге
	24 VDC power fault	When the 24 VDC power output via terminal PC is shorted, or when the external 24 VDC power supplied to terminal +24 is not enough, this function shuts off the power output.	E. P24
	Abnormal output current detection *8	Appears when the output current is out of the output current detection range set by parameters.	E. C40
	Inrush current limit circuit fault	Appears when the resistor of the inrush current limit circuit overheated. (Standard models and IP55 compatible models only)	E. I 0H
	Communication fault (inverter)	Appears when a communication error occurred during the RS-485 communication with the RS-485 terminals. (This function is not intended for the FR-A800-E.)	E. SER
	Analog input fault	Appears when 30 mA or more is input or a voltage (7.5 V or more) is input with terminal 2/4 set to current input.	E. RI E
	USB communication fault	Appears when USB communication error occurred.	E. USb
	Safety circuit fault	The inverter trips when a safety circuit fault occurs.	E. SAF
	Overspeed occurrence *8	Indicates that the motor speed has exceeded the overspeed setting level (Pr.374). Stops the inverter output if the motor speed is increased or decreased under the influence of the load	<u>E. 05</u>
	Speed deviation excess detection *7 *8	etc. during vector control and cannot be controlled in accordance with the speed command value.	<u>E. 05d</u>
	Signal loss detection *7 *8	Stops the inverter output if the encoder signal is shut off. Indicates that the difference between the position command and position feedback exceeded the	<u>E. ECT</u>
	Excessive position fault *8	reference.	E. Od
	Brake sequence fault *8	The inverter output is stopped when a sequence error occurs during use of the brake sequence function (Pr.278 to Pr.285).	E. Mb 1to E. Mb 7
	Encoder phase fault *7 *8	When the rotation command of the inverter differs from the actual motor rotation direction detected from the encoder, the inverter output is stopped. (detected only during tuning is performed in the "rotation mode" of offline auto tuning) (This function is not available in the FR-A842-P.)	E. EP

Name		Description		ation panel dication
	Magnetic pole position unknown *7	When the offset value between the motor home magnetic pole position and the resolver home position is unknown, the protective circuit is activated to stop the inverter output. (This function is not available in the FR-A842-P.)	E.	72
	External fault during output operation	When the X32 signal turns OFF (the contact opens) due to an external fault or other factor, the inverter output is shut off.	E.	EF
	Abnormal internal temperature	The inverter output is stopped when the internal temperature of the inverter rises abnormally. (IP55 compatible models only)	Ε.	I AH
	4 mA input fault *8	The inverter trips when the analog input current is 2 mA or less for the time set in Pr.778 4 mA input check filter .	E.	
	Pre-charge fault *8	The inverter trips when the pre-charge time exceeds Pr.764 Pre-charge time limit . The inverter trips when the measured value exceeds Pr.763 Pre-charge upper detection level during pre-charging.	E.	PCH
Fault *5	PID signal fault *8	The inverter trips if the measured value exceeds the PID upper limit or PID lower limit parameter setting, or the absolute deviation value exceeds the PID deviation parameter setting during PID control.	E.	13 Q
	Option fault	The inverter trips when a contact fault is found between the inverter and the plug-in option, or when the communication option is not connected to the connector 1.	E. E.	₩.
	Ethernet communication fault	If Ethernet communication is interrupted by physical factors or a no-communication state persists for the permissible time or longer, the inverter trips. (This function is intended for the FR-A800-E only.)	Ε.	EHR
	Opposite rotation deceleration fault *8	The speed may not decelerate during low speed operation if the rotation direction of the speed command and the estimated speed differ when the rotation is changing from forward to reverse or from reverse to forward under real sensorless vector control. At this time, the inverter output is stopped if the rotation direction will not change, causing overload.	Ε.	- 1
	Internal circuit fault	Appears when an internal circuit error occurred.	E. E.	67 19
	User definition error by the PLC function	Appears when the values 16 to 20 are set in the device SD1214 with the program operation of the PLC function.	E. E.	16 to

- *1 *2 *3 *4 *5 *6 *7

- Resetting the inverter initializes the internal cumulative heat value of the electronic thermal O/L relay function.

 The error message shows an operational error. The inverter output is not shut off.

 Warnings are messages given before faults occur. The inverter output is not shut off.

 Alarm warn the operator of failures with output signals. The inverter output is not shut off.

 When faults occur, the protective functions are activated to shut off the inverter output and output the alarms.

 The external thermal operates only when the OH signal is set in Pr.178 to Pr.189 (input terminal function selection).

 Appears when a vector control compatible option is installed. (The protective function may or may not be available depending on the type of the connected computing the protection). communication option.)
 This protective function is not available in the initial status.

The list of converter unit protective functions

When the converter unit detects a fault, depending on the nature of the fault, the operation panel displays an error message or warning, or a protective function is activated to trip the inverter.

Name		Description	Operation panel indication	
	Fault history	The operation panel stores the fault indications which appears when a protective function is activated to display the fault record for the past eight faults.	E	
*2	Operation panel lock	Appears when operation was tried during operation panel lock.	HOLd	
ssag	Password locked	Appears when a password restricted parameter is read/written.	LOCa	
Error message	Parameter write error	Appears when an error occurred during parameter writing.	E- I	
	Copy operation error	Appears when an error occurred during parameter copying.	rE ItorE4	
	Error	Appears when the RES signal is on or the PU and converter unit can not make normal communication.	Err.	
*3	Electronic thermal relay function pre-alarm	Appears when the electronic thermal O/L relay has reached 85% of the specified value.	ΓH	
Warning *3	Maintenance signal output 1 to 3 *7	Appears when the converter unit's cumulative energization time reaches or exceeds the parameter set value.	ML ItoML 3	
Wa	24 V external power supply operation	Blinks when the main circuit power supply is off and the 24 V external power supply is being input.	Εľ	
Alarm *4	Fan alarm	Appears when the cooling fan remains stopped when operation is required or when the speed has decreased.	FN	
	Overvoltage trip	Appears when the converter unit's internal main circuit DC voltage exceeds the specified value.	E. OKT	
	Converter overload trip (electronic thermal relay function) *1	Appears when the electronic thermal O/L relay of the converter unit diode module is activated.	Е. ГНС	
	Heat sink overheat	Appears when the heat sink overheated.	E. FIN	
	Instantaneous power failure	Appears when an instantaneous power failure occurred at an input power supply.	E. PF	
	Undervoltage	Appears when power supply voltage of the converter unit is set at a low level.	E. UKT	
	Input phase loss *7	Appears if one of the three phases on the converter unit input side opened.	E. I LF	
	External thermal relay operation *6	Appears when the external thermal relay connected to terminal OH is activated.	E. OHF	
	Parallel operation slave 1 fault	Appears on the operation panel of the master at an occurrence of a slave converter fault during the parallel operation. Appears on the master converter unit even when the RS-485 terminals are incorrectly connected. (This function is intended for the FR-CC2-P only.)	E. PA I	
	Parallel operation slave 2 fault		E. PA2	
	Parameter storage device fault (control board)	Appears when operation of the element where parameters stored became abnormal. (control board)	E. PE	
*5	PU disconnection	Appears when a communication error between the PU and inverter occurred, the communication interval exceeded the permissible time during the RS-485 communication with the PU connecter, or communication errors exceeded the number of retries during the RS-485 communication.	E. PUE	
Fault *5	Retry count excess *7	Appears when the operation was not restarted within the set number of retries. (This function is not available for the FR-CC2-P.)	E. REC	
	Parameter storage device fault (main circuit board)	Appears when operation of the element where parameters stored became abnormal. (main circuit board)	E. PE2	
	CPU fault	Appears during the CPU and peripheral circuit errors occurred.	E. CPU E. 5° E. 7	
	Operation panel power supply short circuit/RS- 485 terminals power supply short circuit	Appears when the RS-485 terminal power supply or operation panel power supply was shorted.	е. сге	
	24 VDC power fault	When the 24 VDC power output via terminal PC is shorted, or when the external 24 VDC power supplied to terminal +24 is not enough, this function shuts off the power output.	E. P24	
	Inrush current limit circuit fault	Appears when the resistor of the inrush current limit circuit overheated.	E. 1 DH	
	Communication fault (inverter)	Appears when a communication error occurred during the RS-485 communication with the RS-485 terminals.	E. SER	
	Internal circuit fault	Appears when an internal circuit error occurred.	E. P6C E. 13	
	Option fault	The inverter trips if a plug-in option is disconnected while the converter unit power is ON.	E. 1	

- Resetting the converter unit initializes the internal cumulative heat value of the electronic thermal O/L relay function. The error message shows an operational error. The inverter output is not shut off.

 Warnings are messages given before faults occur. The inverter output is not shut off.

- Alarm warn the operator of failures with output signals. The inverter output is not shut off.

 When faults occur, the protective functions are activated to shut off the inverter output and output the alarms.

 The external thermal operates only when the OH signal is set in Pr.178, Pr.180, Pr.187 or Pr.189 (input terminal function selection).
- This protective function is not available in the initial status.

Option and Peripheral Devices

Option List

By fitting the following options to the inverter, the inverter is provided with more functions.

Three plug-in options can be fitted at a time. Two or more of the same options cannot be fitted, and only one communication option can be fitted at a time. (Two options (except for communication options) can be fitted to the FR-A800-GF at a time.)

		Name	Туре	Applications, Specifications, etc.	Applicable Inverter		
			FR-A8AP FR-A8AL	Vector control can be performed for encoder-equipped motors (induction motors).			
		Vector control	FR-A8APR*1 FR-A8APS*1 FR-A8APA*1	Vector control can be performed for encoder-equipped motors (induction/PM motors).			
	E	Orientation control Encoder feedback control	FR-A8AP FR-A8APR*1 FR-A8APS*1 FR-A8APA*1 FR-A8AL	The main spindle can be stopped at a specified position (orientation) in combination with an encoder. The motor speed is sent back and the speed is maintained constant.			
		Position control	FR-A8AL	The external pulse train input enables position control. Connection with the positioning module of a programmable controller is also available.			
	Encoder pulse dividing output		FR-A8APS*1	Position control using point tables is enabled.			
			FR-A8AL FR-A8APD*1	The encoder pulse can be divided for the signal output.			
		16-bit digital input	FR-A8AX	This input interface sets the high frequency accuracy of the inverter using an external BCD or binary digital signal. • BCD code 3 digits / 4 digits • Binary 12 bits / 16 bits	Shared among all models		
				Output signals provided with the inverter as standard are selected to output from the open collector.			
	ı	Digital output Extension analog output	FR-A8AY	This option adds 2 different signals that can be monitored such as the output frequency and output voltage. 20mADC or 10VDC meter can be connected.			
		Relay output	FR-A8AR	Output any three output signals available with the inverter as standard from the relay contact terminals.]		
Plug-in Type	Hi:	Bipolar analog output gh resolution analog input otor thermistor interface *2	FR-A8AZ	This option adds different signals that can be monitored such as the motor torque and torque command by the ± 10 V output. Highly accurate operation is achieved by using high-resolution analog input (16 bits). Thermistor-equipped motors can detect the motor temperature, and the temperature feedback is used to reduce the fluctuation of output torque.

Applicable Inverter

Not available for the FR-A800-E.

Name

Liquid crystal display operation panel

Parameter unit

Type

FR-LU08(-01)

FR-PU07

- Applicable inverters for the ND rating. For the SLD, LD, and HD ratings, different inverters are used depending on the applicable motor capacity. The battery (CR1216: a diameter of 12 mm, a hight of 16 mm) is not bundled.

 To use a parameter unit with battery pack (FR-PU07BB) outside Japan, order a "FR-PU07BB-L" (parameter unit type indicated on the package has L at the end). Since batteries may conflict with laws in countries to be used (new EU Directive on batteries and accumulators, etc.), batteries are not enclosed with an FR-PU07BB. *4 *5 *6

- DC output capacity when the input voltage is 400 VAC. Multiple ratings are not supported. Change the stepdown transformer tap according to the
- input voltage.

 The output voltage is approx. 594 VDC at an input voltage of 400 VAC, approx. 653 VDC at 440 VAC, and approx. 742 VDC at 500 VAC.

 The percentage of the overload current rating is the ratio
- of the overload current to the converter's rated input current. For repeated duty, allow time for the temperatures of the converter and the inverter to return to or below the temperatures under 100% load.
- FR-DU08: IP40 (except for the PU connector)
 The permissible voltage imbalance ratio is 3% or less.
 (Imbalance ratio = (highest voltage between lines average voltage between three lines)/ average voltage between three lines × 100)
- The rated voltage when connecting a motor to the FR-A840-02160(75K) and FR-F840-02160(90K) or higher. If connecting a motor to inverters other than those mentioned above, the rated voltage is 380 to 480 V.

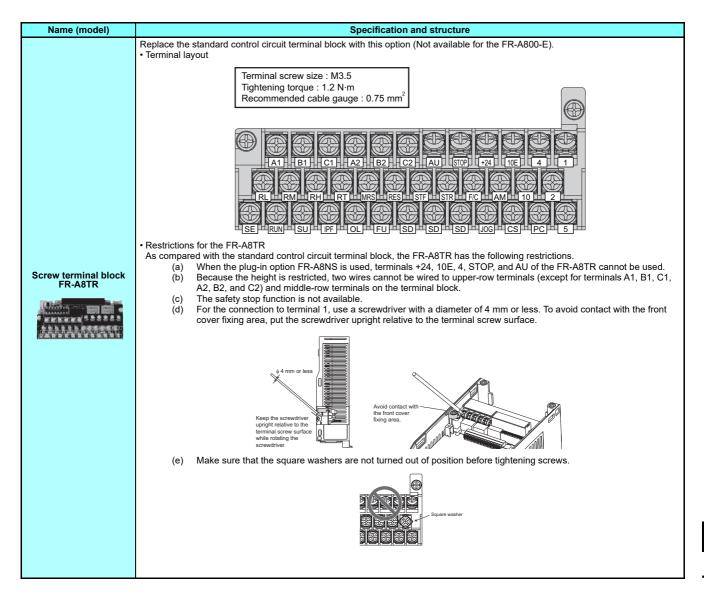

Phase-synchronized bypass switching

Name (model) Specification and structure The phase-synchronized bypass switching function permits smooth switching of the motor power supply from the inverter output power to the commercial power. The shock caused by the switch is suppressed because the inverter output voltage phase is synchronized with the commercial power voltage phase. Use with a phase detection transformer box (FR-A8VPB-H). • Connection diagram <<Example for the standard model or IP55 compatible model of the FR-A800 series inverter>> External мссв MC1 thermal relay S1/L21 R2 STF CS MRS Inverter start (forward rotation) Inverter/bypass Operation interlock Phase synchronization command PWS *3 for bypass switching 10 SE Frequency setting signal Phase-synchronized bypass switching FR-A8AVP << Example for the separated converter type of the FR-A800 series inverter>> FR-A8VPB-H AC reactor (FR-HAL) *6 External Converter unit MC1 R/L1 S/L2 T/L3 Inverter start (forward rotation) Inverter/bypass Operation interlock Phase synchronization and for bypass switching N/-STF PRH(MRS) *3 PPWS *3 PSD SE RDA *5 ALM MRS(X10) X95*3 X96*3 24 VDC RES thermal RSO RES Reset FR-A8VPB FR-A8AVP R2 TS2 T2 TS2 T2 Be careful of the capacity of the sequence output terminals. The applied terminals differ depending on the settings of Pr.190 to Pr.196 (Output terminal function selection). **Output terminal capacity** Output terminal permissible load Open collector output of inverter (RUN, SU, IPF, OL, FU) 24 VDC 0.1 A Inverter relay output (A1-C1, B1-C1, A2-B2, B2-C2) Relay output option (FR-A8AR) 230 VAC 0.3 A 30 VDC 0.3 A When connecting a DC power supply, insert a protective diode. When connecting an AC power supply, use the relay output option (FR-A8AR), and use contact outputs. *2 The applied terminals differ depending on the settings of Pr.180 to Pr.189 (Input terminal function selection) *4 Use the wires satisfying the following requirements for each wiring location. Wiring location **Total wiring length** Wire gauge (mm²) Wiring between the power supply and the 2 10 m or less phase detection transformer box Wiring between the phase detection transformer box and the inverter 0.75 to 1.25 To use the signal, assign the function to the output terminal using Pr.190 to Pr.195 (Output terminal function selection) in the converter unit. Always set the negative logic for the ALM signal. When using an AC reactor, connect the reactor as specified in the diagram

This attachment allows the conventional FR-A700/A500 series control circuit terminal blocks to be installed without removing any cables. This attachment is useful for replacing a conventional inverter with the FR-A800 series inverter. FR-A8TAT FR-A8TAT FR-A700/A500 series

Control circuit terminal block intercompatibility attachment FR-A8TAT

> AC reactor (for power supply coordination) FR-HAL-(H)[]K

Name (model)

(a) For using the control circuit terminal block of the FR-A500 series, open or remove the cover of the control circuit terminal block. Otherwise, the front cover of the inverter may not close properly.
 (b) Since the specifications of the control circuit terminals of the FR-A700/A500 series are different from those of the FR-A700/A500 series.

Specification and structure

(b) Since the specifications of the control circuit terminals of the FR-A700/A500 series are different from those of the FR-A800 series, certain functions of the inverter are restricted (refer to the table below).

	Relay output 2 terminals	24 V external power supply input terminal	Safety stop signal terminals
FR-A500 series	×	×	×
FR-A700 series	0	×	×

O ... Available. x... Not available

control circuit terminal block

- c) The FR-A8NC, FR-A8NCE, or FR-A8NS plug-in option cannot be installed.
- (d) When using a plug-in option, connect the plug-in option using a cable that can be routed through the space between the front cover and the control circuit terminal block (FR-A700 series: 7 mm, FR-A500 series: 0.8 mm).

Improves the power factor and reduces the harmonic current at the input side. Connect an AC reactor at the input side of the inverter.

• Selection method

Select an AC reactor according to the applied motor capacity. (Select the AC reactor according to the motor capacity even if the capacity is smaller than the inverter capacity.)

- (a) Approximately 88% of the power factor improving effect can be obtained (92.3% when calculated with 1 power factor for the fundamental wave according to the Architectural Standard Specifications (Electrical Installation) (2013 revision) supervised by the Ministry of Land, Infrastructure, Transport and Tourism of Japan).
- (b) This is a sample outline dimension drawing. The shape differs by the model. W1 and D1 indicate distances between installation holes. The installation hole size is indicated by d.
- indicated by d.

 (c) When installing an AC reactor (FR-HAL), install in the orientation shown below.

 •(H)55K or lower: Horizontal installation or vertical installation

 •(H)75K or higher: Horizontal installation
- (d) Keep enough clearance around the reactor because it heats up. (Keep a clearance of minimum 10cm each on top and bottom and minimum 5cm each on right and left regardless of the installation orientation.)

Specification and structure Name (model) Improves the power factor and reduces the harmonic current at the input side. Make sure to install this option for the FR-A820-03800(75K) or higher and the FR-A840-02160(75K) or higher. Also install this option when using a motor of 75 kW or higher capacity. (The IP55 compatible model has a built-in DC reactor.) Selection method Select a DC reactor according to the applied motor capacity. (Select it according to the motor capacity even if the capacity is smaller than the inverter capacity.) (Refer to page 223.) Connection diagram Connect a DC reactor to the inverter terminals P1 and P. Remove the jumper across terminals P1 and P. If the jumper is left attached, no power factor improvement can be obtained. (The jumper is not installed for the FR-A820-03800(75K) or higher and the FR-A840-02160(75K) or higher.) The connection cable between the reactor and the inverter should be as short as possible (5m or less).) FR-BU2-H280K

[GRZG type]

- The maximum temperature rise of the discharging resistors is about 200°C. Use heat-resistant wires to perform wiring, and make sure that they will not come in contact with resistors.
- Do not touch the discharging resistor while the power is ON or for about 10 minutes after the power supply turns OFF. Otherwise you may get an electric shock.

[MT-BR5]

- Be sure to select a well-ventilated place for the installation of the resistor unit. Ventilation is necessary when installing the resistor in a place such as an enclosure, where heat is not well diffused.
- The maximum temperature rise of the resistor unit is about 300°C. When wiring, be careful not to touch the resistor. Also, keep any heat-sensitive component away from the resistor (minimum 40 to 50 cm).
- The temperature of the resistor unit abnormally increases if the brake unit is operated exceeding the specified duty. Since the resistor unit may result in overheat if the temperature of the brake unit is left unchanged, switch off the inverter. A resistor unit is equipped with thermostat (NO contact) for overheat protection. If this protective thermostat activates in normal
- operation, the deceleration time may be too short. Set the inverter's deceleration time longer.

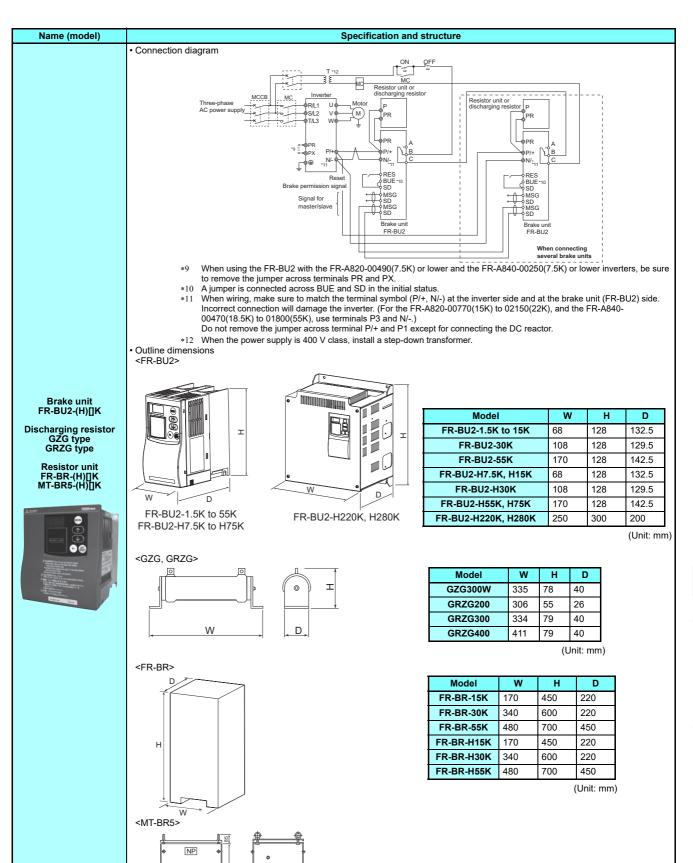

%ED at short-time rating when braking torque is 100%

Name (model)

Specification and structure

One inverter can handle harmonic suppression and power regeneration.

Functions that match the application can be selected by combining the inverter/converter with the dedicated reactor FR-XCB (boxtype) or FR-XCL.

Name (model) Sufficient Sufficie

Specification and structure

Substantially suppresses power harmonics to obtain the equivalent capacity conversion coefficient K5 = 0 specified in "the Harmonic Suppression Guidelines for Consumers Who Receive High Voltage or Special High Voltage" in Japan.

The power regeneration function comes standard.

The common converter driving with several inverters is possible.

Selection method

Select the model according to capacity of the inverter or the applicable motor, whichever larger.

Specification and structure

Name (model) Specification and structure · Sine wave filter application A sine wave filter can be installed to adjust the motor voltage and current waveforms to be sine waves. Install a sine wave filter to the output side of the inverter . This filter is compatible with the FR-A820-03800(75K) or higher and the FR-A840-02160(75K) or (This product is available only with general-purpose motors.) A sine wave filter will bring operation characteristic equivalent to the operation with a sine wave power supply and also will provide the following benefits. A sine wave filter will bring operation characteristic equivalent to the operation with a sine wave power supply and also will provide the following benefits. Low noise (b) No surge current Small motor losses (for a standard motor) Operating condition The following settings and conditions are required to use a sine wave filter. Set "25" in Pr.72. (The initial value is "2".) This setting changes the carrier frequency to 2.5 kHz. (A sine wave filter is designed on the assumption of 2.5 kHz carrier frequency. Always change this setting.) The operation with **Pr.72** = "25" setting may damage inverter and the sine wave filter. A sine wave filter can be used for the operation with an inverter output frequency of 60 Hz or lower. It cannot be used for the operation with higher frequency. (Using it with the higher frequency will increases the filter loss.) It is applicable only under V/F control. (When **Pr.72** = "25", V/F control is automatically set.) When using the sine wave filter and the FR-HC2 together, use the MT-BSL-HC. Circuit configuration and connection

 Noise filter wiring example Install the recommended EMI filter by Soshin Electric Co., Ltd. to the input side of the inverter, as shown below.

• Recommended ferrite core (IP55 compatible model)

To support compliance with shipping classifications, install the recommended ferrite core (ESD-SR-250 manufactured by TOKIN Corporation) or an equivalent by two turns (passing the cable twice through the core) for wiring of control circuit terminals for electromagnetic compatibility (EMC).

Example of installing ferrite cores

For using one ferrite core

For using two ferrite cores

Low-Voltage Switchgear/Cables

Mitsubishi Electric Molded Case Circuit Breakers and Earth Leakage Circuit Breakers WS-V Series

"WS-V Series" is the new circuit breakers that have a lot of superior aspects such as higher breaking capacity, design for easy use, standardization of accessory parts, and compliance to the global standards.

Features

Technologies based on long years of experience are brought together to achieve improved performance

The new circuit breaking technology "Expanded ISTAC" has improved the currentlimiting performance and upgraded the overall breaking capacity. Expansion of the conductor under the stator shortens the contact parting time of the mover as compared to the conventional ISTAC structure.

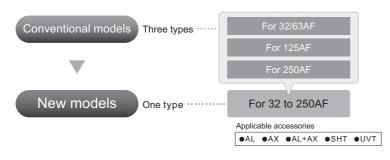

The current-limiting performance has been improved remarkably. (The maximum peak current value has been reduced by approx. 10%.)

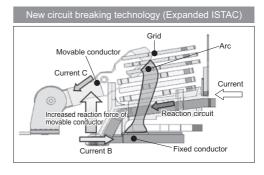

• Compact design for ease of use

The thermal adjustable circuit breakers and electronic circuit breakers are smaller.

• Types of internal accessories are reduced from 3 types to 1 type Standardization of internal accessories contributes to a reduction of stock and delivery time.

Breaking capacity comparison with a conventional model

250-RG

The compact breakers contribute to a size reduction of machines, and IEC 35 mm rail mounting is standard.

For security and standard compliance of machines, F-type and V-type operating handles are available for breakers with 54 mm width.

◆ Lineup of UL 489 listed circuit breakers for 480 V AC "High Performance"

The breaking capacity has been improved to satisfy the request for SCCR upgrading.

Mitsubishi Electric Magnetic Motor Starters and Magnetic Contactors MS-T Series

Mitsubishi Electric magnetic motor starters have been newly designed and the MS-T series has been released..

The MS-T series is smaller than ever, enabling more compact control panel. The MS-T series is suitable for other Mitsubishi Electric FA equipment. In addition, the MS-T conforms to a variety of global standards, supporting the global use.

Features

Compact

The width of the 10 A-frame model is as small as 36 mm.

General-purpose magnetic contactor with smallest width*1 in the industry.

The width of MS-T series is reduced by 32% as compared to the prior MS-N series, enabling a more compact panel. For selection, refer to **page 215**.

*1 Based on Mitsubishi Electric research as of September 2015 in the general-purpose magnetic contactor industry for 10 A-frame class.

Standardization

New MS-T series

- Covers provided as standard equipment
 Safety improvement is achieved by the standard terminal cover.
 It is not necessary for the new MS-T series to order a dedicated terminal cover (S-N[]CX) or a retrofit cover (UN-CW, etc.), which is required for the former MS-N series. (Prevention of failure to order) The number of items in stock can be reduced.
- The standard integrated terminal cover eliminates the need for additional ordering.
- Widened range of operation coil ratings (AC operated model)
 The widened range reduces the number of operation coil rating types from 13 (MS-N series) to 7.
 - The reduced number of the operation coil types enables more simplified customers' ordering process and the faster delivery.
- Customers can select the operation coil more easily.

 (MS-T series)

Coil designation	Rated voltage [V]	50 Hz/60 Hz	
24 VAC	24	48 VAC	48 to 50
100 VAC	100 to 127		
200 VAC	200 to 240		
300 VAC	260 to 300		
400 VAC	380 to 440		
500 VAC	460 to 550		

*12 VAC type is made on order.

Global Standard

• Conforms to various global standards

Our magnetic contactors are certified as compliant not only with major international standards such as IEC, JIS, UL, CE, and CCC but also with ship classification standards and country specific standards.

This will help our customers expand their business overseas.

Ī			Safety Standard				
ı		International	Japan	Eur	ope	China	U.S.A./ Canada
ı				EN	Certification	GB	
ı	Standard			EC Directive	body	GB	
		IEC _{*2}	JIS	CE	TÜV Rheinkand	((() *3	c (UL) us

- *2 The MS-T series also provide safe isolation (mirror contact) specified in the IEC standard.
- *3 The motor starters are certified under each type name of the magnetic contactors and the thermal overload relays on the condition that the magnetic contactors and the thermal overload relays are used in combination.

Mitsubishi Electric Magnetic Motor Starters and Magnetic Contactors MS-N Series (32 A-Frame Class or Higher)

Environment-friendly Mitsubishi Electric MS-N series ensures safety and conforms to various global standards. Its compact size contributes to space-saving in a machine. The MS-N series is suitable for other Mitsubishi Electric FA equipment and can be used globally.

♦ Features

Bifurcated contact adopted to achieve high contact reliability

Contact reliability is greatly improved by combining bifurcated moving contact and stationary contact. This series responds to the various needs such as the application to safety circuit. (The MS-T series also has bifurcated contacts.)

The MS-N series meets requirements of "Control functions in the event of failure" described in EN 60204-1 "Electrical equipment of machines", being suitable as interlock circuit contact. The MS-N series is applicable for category 4 safety circuit. We ensure safety for our customers. (The MS-T series also has mirror contacts.)

Various options including surge absorbers and additional auxiliary contact blocks are available.

Motor Circuit Breaker MMP-T Series

Motor circuit protection (against overload / phase loss / short-circuit) is achievable the MMP-T series alone. The wire-saving, space-saving design enables downsizing of the enclosure.

The MMP-T series can be used in combination with the MS-T series (DC operated model).*1

*1 The connection conductor unit for the DC operated compact model (SD-T) is to be released soon.

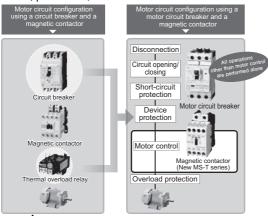

MMP-T32

Features

• What is the motor circuit breaker?

The motor circuit breaker, applicable to the motor circuit, has the functions of a circuit breaker and a thermal overload relay in one unit. The motor circuit breaker provides protection against overload, phase loss, and short circuit.

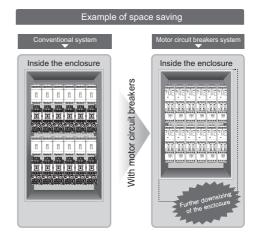

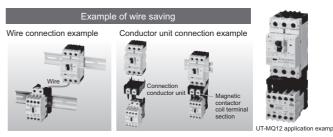

Wire saving

Using a connection conductor unit (option) for connecting a motor circuit breaker and a contactor reduces work hours required for wiring.

A connection conductor unit for the high sensitivity contactor (SD-Q) is also available. (Model: UT-MQ12)

Space-saving design for downsizing of the enclosure

• Compliance to major standards support customers' overseas business

· Compliance with major global standards

Not only major international standards such as IEC, JIS, UL, CE, and CCC but also other national standards are certified. This will help our customers expand their business in foreign countries.

		,	Applicable Standa	ırd		Safety Standard
	International	International Japan Europe		ope China		U.S.A./ Canada
04			EN	Certification	GB	
Standard	IEC	JIS	EC Directive	body	GB	
	IEC	JIS	CE	TOV Sheinfami		c (UL) us

UL60947-4-1A Type E/F is also covered.
 Compliance of the device to UL's Type E/F combination can surely support export to the United States.

• Selecting the rated sensitivity current for the earth leakage circuit breaker

When using an earth leakage circuit breaker with the inverter circuit, select its rated sensitivity current as follows, independently of the PWM carrier frequency.

- Breaker designed for harmonic and surge suppression Rated sensitivity current
 - $I\Delta n \ge 10 \times (Ig1+Ign+Igi+Ig2+Igm)$
- Standard breaker
 - Rated sensitivity current
 - $|\Delta n \ge 10 \times \{|g1+|gn+|gi+3 \times (|g2+|gm)\}|$
 - Ig1, Ig2: Leakage currents in wire path during commercial power supply operation
 - Ign: Leakage current of inverter input side noise filter
 - Igm: Leakage current of motor during commercial power supply operation
 - Igi: Leakage current of inverter unit

Example of leakage current of cable path per 1 km during the commercial power supply operation when the CV cable is routed in metal conduit (200 V 60 Hz)

- Assumes the use of a Mitsubishi Electric 4-pole standard motor with the motor capacity of 200 VAC 50 Hz.
- Select an MCCB according to the power supply capacity. Install one MCCB per inverter.

(For the use in the United States or Canada, refer to "Instructions for UL and cUL" in the Instruction Manual (Startup), and select an appropriate fuse or molded case circuit breaker (MCCB).)

Cables For the FR-A820-03160(55K) or lower and the FR-A840-01800(55K) or lower, it is the gauge of a cable with the continuous maximum permissible temperature of 75°C. (HIV cable (600 V grade heat-resistant PVC insulated wire), etc.) It assumes a surrounding air temperature of 50°C or lower and the wiring distance of 20 m or shorter.

For the FR-A820-03800(75K) or higher and the FR-A840-02160(75K) or higher, it is the gauge of the cable with the continuous maximum permissible temperature of 90°C or higher. (LMFC (heat resistant flexible cross-linked polyethylene insulated cable), etc.) It assumes a surrounding air temperature of 50°C or lower and in-enclosure wiring.

- When the inverter capacity is larger than the motor capacity, select an MCCB and a magnetic contactor according to the inverter model, and select cables and reactors according to the motor output.
- · When the breaker on the inverter's input side trips, check for the wiring fault (short circuit), damage to internal parts of the inverter etc. The cause of the trip must be identified and removed before turning ON the power of the breaker.

315K or higher

				Molded case circuit breaker (MCCB) *2		HIV cables, etc. (mm ²) *4		
Voltage	Motor output (kW) *1	Applicable inverter model (ND rating)	Applicable converter model	or earth leakage circuit breaker (ELB) (NF, NV type)	Input-side magnetic contactor *3	R/L1, S/L2, T/L3	P/+, N/-	U, V, W
	315	FR-A842-07700(315K)	FR-CC2-H315K	700 A	S-N600	2×150	2×150	2×150

	500	FR-A842-12120(500K)	FR-CC2-H500K	1200 A	1000 A rated product	3×200	3×200	2×250

- *1 Assumes the use of a Mitsubishi Electric 4-pole standard motor with the motor capacity of 400 VAC
- *2 Select an MCCB according to the power supply capacity. Install one MCCB per converter.

(For the use in the United States or Canada, refer to "Instructions for UL and cUL" in the Instruction Manual (Hardware), and select an appropriate fuse or molded case circuit breaker (MCCB).)

- *3 The magnetic contactor is selected based on the AC-1 class. The electrical durability of magnetic contactor is 500,000 times. When the magnetic contactor is used for emergency stops during motor driving, the electrical durability is 25 times.

 If using an MC for emergency stop during driving the motor, select an MC regarding the converter unit input side current as JEM1038-AC-3 class rated current. When using an MC on the inverter output side for commercial-power supply operation switching using a general-purpose motor, select an MC regarding the rated motor current as JEM1038-AC-3 class rated current.
- *4 The gauge of the cable with the continuous maximum permissible temperature of 90°C or higher. (LMFC (heat resistant flexible cross-linked polyethylene insulated cable), etc.). It assumes a surrounding air temperature of 40°C or lower and in-enclosure wiring.

NOTE:

- When the converter unit capacity is larger than the motor capacity, select an MCCB and a magnetic contactor according to the converter unit
 model, and select cables and reactors according to the motor output.
- When the breaker on the converter unit's input side trips, check for the wiring fault (short circuit), damage to internal parts of the inverter and the converter unit, etc. The cause of the trip must be identified and removed before turning ON the power of the breaker.

Precaution on Selection and Operation

Precautions for use

- To use the product safely and correctly, make sure to read the "Instruction Manual" before the use.
- This product has not been designed or manufactured for use with any equipment or system operated under life-threatening conditions.
- Please contact our sales representative when considering using this product in special applications such as passenger mobile, medical, aerospace, nuclear, power or undersea relay equipment or system.
- Although this product was manufactured under conditions of strict quality control, install safety devices to prevent serious accidents when it is used in facilities where breakdowns of the product or other failures are likely to cause a serious accident.
- Do not use the inverter for a load other than the three-phase induction motor and the PM motor.
- Do not connect a PM motor in the induction motor control settings (initial settings). Do not use an induction motor in the PM sensorless vector control settings. It will cause a failure.
- When using an IPM motor (MM-CF), also refer to the precautions for use of the IPM motors (MM-CF).

Operation

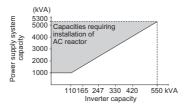

- When a magnetic contactor (MC) is installed on the input side, do not use the MC for frequent starting/stopping. Otherwise the inverter may be damaged.
- When a fault occurs in the inverter, the protective function is acticvated to stop the inverter output. However, the motor cannot be immediately stopped. For machinery and equipment that require an immediate stop, provide a mechanical stop/holding mechanism.
- Even after turning OFF the inverter/the converter unit, it takes time to discharge the capacitor. Before performing an inspection, wait 10 minutes or longer after the power supply turns OFF, then check the voltage using a tester, etc.

Wiring

- Applying the power to the inverter output terminals (U, V, W)
 causes a damage to the inverter. Before power-on, thoroughly
 check the wiring and sequence to prevent incorrect wiring, etc.
- Terminals P/+, P1, N/-, and P3 are the terminals to connect dedicated options or DC power supply (in the DC feeding mode).
 Do not connect any device other than the dedicated options or DC power supply (in the DC feeding mode). Do not short-circuit between the frequency setting power supply terminal 10 and the common terminal 5, and between terminals PC and SD.
- To prevent a malfunction due to noise, keep the signal cables 10cm or more away from the power cables. Also, separate the main circuit cables at the input side from the main circuit cables at the output side.
- After wiring, wire offcuts must not be left in the inverter/the
 converter unit. Wire offcuts can cause an alarm, failure or
 malfunction. Always keep the inverter/the converter unit clean.
 When drilling mounting holes in an enclosure etc., take caution
 not to allow chips and other foreign matter to enter the inverter/
 the converter unit.
- Set the voltage/current input switch correctly. Incorrect setting may cause a fault, failure or malfunction.

Power supply

 When the inverter is connected near a largecapacity power transformer (1000 kVA or more) or when a power factor correction capacitor is to be switched over, an excessive peak current may flow in the power input circuit, damaging the

inverter. To prevent this, always install an optional AC reactor (FR-HAL).

 If surge voltage occurs in the power supply system, this surge energy may flow into an inverter, and the inverter may display the overvoltage protection (E. OV[]) and trip. To prevent this, install an optional AC reactor (FR-HAL).

♦ Installation

- Install the inverter in a clean place with no floating oil mist, cotton
 fly, dust and dirt, etc. Alternatively, install the inverter inside the
 "sealed type" enclosure that prevents entry of suspended
 substances. For installation in the enclosure, decide the cooling
 method and the enclosure size to keep the surrounding air
 temperature of the inverter/the converter unit within the
 permissible range (for specifications, refer to page 33).
- Some parts of the inverter/the converter unit become extremely hot. Do not install the inverter/the converter unit to inflammable materials (wood etc.).
- Attach the inverter vertically.

Setting

- Depending on the parameter setting, high-speed operation (up to 590 Hz) is available. Incorrect setting will lead to a dangerous situation. Set the upper limit by using the upper frequency limit setting.
- Setting the DC injection brake operation voltage and operating time larger than their initial values causes motor overheating (electronic thermal O/L relay trip).

♦ Real sensorless vector control

- Under Real sensorless vector control, always execute offline auto tuning before starting operations.
- The selectable carrier frequencies under Real sensorless vector control are 2, 6, 10, and 14 kHz.
- Torque control is not available in the low-speed (about 10 Hz or less) regenerative range, or in the low speed with the light load (about 5 Hz or less with about 20% or less of the rated torque).
 Select the vector control.
- Performing pre-excitation (LX signal and X13 signal) under torque control may start the motor running at a low speed even when the start command (STF or STR) is not input. The motor may run also at a low speed when the speed limit value = 0 with a start command input. Confirm that the motor running will not cause any safety problem before performing pre-excitation.
- Under torque control, do not switch between the forward rotation command (STF) and reverse rotation command (STR). The overcurrent trip (E. OC[]) or opposite rotation deceleration fault (E.11) occurs.
- For FR-A820-00250(3.7K) or lower and FR-A840-00126(3.7K) or lower, if continuous operation is performed under Real sensorless vector control, speed fluctuation may increase at 20 Hz or lower, or insufficient torque may occur in a low-speed range under 1 Hz. In such a case, stop the inverter once and re-accelerate it.
- If the inverter may restart during coasting under Real sensorless vector control, set the automatic restart after instantaneous power failure function to enable frequency search (Pr.57 ≠ "9999", Pr.162 = "10").
- Under Real sensorless vector control, sufficient torque may not be obtained in the extremely low-speed range of about 2 Hz or less
- The approximate speed control range is as described below.
 Power drive: 1:200 (2, 4, 6 poles), 0.3 Hz or more for 60 Hz rating
- 1:30 (8, 10 poles), 2 Hz or more for 60 Hz rating Regenerative driving: 1:12 (2 to 10 poles), 5 Hz or more for 60 Hz rating

Waterproof and dustproof performances (IP55 compatible model)

- The inverter is rated with an IPX5*1 waterproof rating and an IP5X*2 dustproof rating when the operation panel (FR-DU08-01), the front cover, the wiring cover, and the cable glands are securely fixed with screws.
- The items enclosed with the inverter such as the Instruction Manual or CD are not rated with the IPX5 waterproof or IP5X dustproof ratings.
- Although the inverter is rated with the IPX5 waterproof and IP5X dustproof ratings, it is not intended for use in water. Also, the ratings do not guarantee protection of the inverter from needless submersion in water or being washed under strong running water such as a shower.
- Do not pour or apply the following liquids over the inverter: water containing soap, detergent, or bath additives; sea water; swimming pool water; warm water; boiling water; etc.
- The inverter is intended for indoor*4 installation and not for outdoor installation. Avoid places where the inverter is subjected to direct sunlight, rain, sleet, snow, or freezing temperatures.
- If the operation panel (FR-DU08-01) is not installed, if the screws
 of the operation panel are not tightened, or if the operation panel
 is damaged or deformed, the IPX5 waterproof performance and
 the IP5X dustproof performance are impaired. If any
 abnormalities are found on the operation panel, ask for an
 inspection and repair.
- If the screws of the front cover or the wiring cover are not tightened, if any foreign matter (hair, sand grain, fiber, etc.) is stuck between the inverter and the gasket, if the gasket is damaged, or if the front cover or the wiring cover is damaged or deformed, the IPX5 waterproof performance and the IP5X dustproof performance are impaired. If any abnormalities are found on the front cover, wiring cover, or the gasket of the inverter, ask for an inspection and repair.
- Cable glands are important components to maintain the waterproof and dustproof performances. Be sure to use cable glands of the recommended size and shape or equivalent. The standard protective bushes cannot sufficiently maintain the IPX5 waterproof performance and the IP5X dustproof performance.
- If a cable gland is damaged or deformed, the IPX5 waterproof performance and the IP5X dustproof performance are impaired. If any abnormalities are found on the cable glands, ask the manufacturer of the cable glands for an inspection and repair.
- To maintain the waterproof and dustproof performances of the inverter, daily and periodic inspections are recommended regardless of the presence or absence of abnormalities.
 - *1 IPX5 refers to protection of the inverter functions against water jets from any direction when about 12.5-liter water-3 is injected from a nozzle with an inside diameter of 6.3 mm from the distance of about 3 m for at least 3 minutes.
 - *2 IP5X refers to protection of the inverter functions and maintenance of safety when the inverter is put into a stirring device containing dust of 75 μm or smaller in diameter, stirred for 8 hours, and then removed from the device.
 - *3 Water here refers to fresh water at room temperature (5 to 35°C).
 - Indoor here refers to the environments that are not affected by climate conditions.

Precautions for use of IPM motor (MM-CF)

For using an IPM motor (MM-CF), also check the following precautions.

♦ **∱** Safety instructions

 Do not use an IPM motor for an application where the motor is driven by the load and runs at a speed higher than the maximum motor speed.

Combination of motor and inverter

- The motor capacity is equal to or one rank lower than the inverter capacity. (It must be 0.4 kW or higher.)
 - Using a motor with the rated current substantially lower than the inverter rated current will cause torque ripples, etc. and degrade the speed and torque accuracies.
 - As a reference, select the motor with the rated motor current that is about 40% or higher of the inverter rated current.
- · Only one IPM motor can be connected to an inverter.
- An IPM motor cannot be driven by the commercial power supply.

Installation

- While power is ON or for some time after power-OFF, do not touch the motor since the motor may be extremely hot. Touching these devices may cause a burn.
- An outline dimension differs between MM-CF and a standard motor
- Do not apply the load larger than the permissible load to the motor shaft. Doing so may lead to breakage of the shaft.
- Avoid places where the equipment is subjected to oil mist, dust, dirt, etc. for installation.
 When it is inevitable to install the equipment in such a place, tak
 - When it is inevitable to install the equipment in such a place, take such measures as to provide a cover to the motor.
- Always use the motor at the specified surrounding air temperature. Increase in the motor temperature may cause the torque to decrease.
- When installing the motor with its shaft facing upward, take countermeasures on the machine side to avoid infiltration of oils from the gear box, etc.
- Select the appropriate cable clamping method to avoid bending stresses or stresses from its own weight at the cable joint section.
- For certain applications in which the motor moves, determine the cable bending radius based on the necessary bending life and the cable type.
- To prevent moving of the power supply cable coming out of the motor, take such measures as to fix the cable to the motor. Otherwise the cable may break.
- Do not modify the connector, terminal, etc. at the end of the cable.

♦ Earth (ground)

- To prevent an electric shock and to stabilize the potential of control circuit, always earth (ground) the motor and inverter.
- Earth (ground) the motor and inverter at one point. Connect the both earth (ground) terminals for the ground connection from the inverter side.

Wiring

- Applying the commercial power supply to input terminals (U,V, W)
 of a motor will burn the motor. The motor must be connected with
 the output terminals (U,V, W) of the inverter.
- Do not install a magnetic contactor at the inverter's output side.
- An IPM motor is a motor with permanent magnets embedded inside. High voltage is generated at the motor terminals while the motor is running. Before wiring or inspection, confirm that the motor is stopped.
- In an application, such a as fan or blower, where the motor is driven by the load, a low-voltage manual contactor must be connected at the inverter's output side, and wiring and inspection must be performed while the contactor is open. Otherwise an electric shock may be caused. The inverter power must be turned ON before closing the contacts of the contactor at the output side.
- Match the input terminals (U, V, W) of the motor and the output terminals (U, V, W) of the inverter when connecting.
- Keep the wiring length to 100 m or shorter when connecting an IPM motor

Operation

- About 0.1 s (magnetic pole detection time) takes to start a motor after inputting a start signal.
- An IPM motor is a motor with embedded permanent magnets. Regression voltage is generated when the motor coasts at an instantaneous power failure or other incidents. The inverter's DC bus voltage increases if the motor coasts fast in this condition. When using the automatic restart after

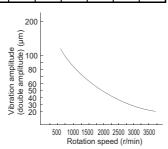

this condition. When using the automatic restart after instantaneous power failure function, it is recommended to also use the regeneration avoidance operation to make startups stable.

The relationship between speed and frequency setting is:
 Speed = 120 × frequency setting value / number of motor poles

Speed (r/min)	300	600	900	1200	1500	1800	2000	2400	2700	3000
MM-CF (8 poles) frequency setting (Hz)	20	40	60	80	100	120	133.33	160	180	200

Permissible vibration of the motor

 Bearing is subjected to fretting while the motor is stopped. Suppress the vibration to about the half of the permissible value.
 Amplitude at each vibration condition is as shown right.

Permissible load of the shaft

- Use the flexible coupling to decrease the shaft center gap to keep its radial load value within the permissible radial load of the shaft.
- When selecting a pulley, sprocket or timing belt, keep its radial load value within the permissible radial load value.
- Do not use a rigid coupling because it gives excessive bending force to the shaft and may break the shaft.

Motor	L (mm) *1	Permissible radial load (N)	Permissible thrust load (N)
MM-CF52(C)(B) to152(C)(B)	55	980	490
MM-CF202(C)(B) to352(C)(B) MM-CF502(C) to702(C)	79	2058	980

*1 For "L" in the table, refer to the figure below.

Selection precautions

♦ Inverter capacity selection

 When operating a special motor or multiple motors in parallel by one inverter, select the inverter capacity so that 1.05 times of the total of the rated motor current becomes less than the rated output current of the inverter.
 (Multiple PM motors cannot be connected to an inverter.)

Starting torque of the motor

• The starting and acceleration characteristics of the motor driven by an inverter are restricted by the overload current rating of the inverter. In general, the torque characteristic has small value compared to when the motor is started by a commercial power supply. When a large starting torque is required, and torque boost adjustment, Advanced magnetic flux vector control, Real sensorless vector control, and vector control cannot generate the sufficient torque, select the HD rating, or increase both the motor and inverter capacities.

◆ Acceleration/deceleration time

- The motor acceleration/deceleration time is decided by the torque generated by the motor, load torque, and moment of inertia (J) of load
- The required time may increase when the torque limit function or stall prevention function operates during acceleration/ deceleration. In such a case, set the acceleration/decelerations time longer.
- To shorten the acceleration/deceleration time, increase the torque boost value (too large setting value may activate the stall prevention function, resulting in longer acceleration time at starting on the contrary). Alternatively, use Advanced magnetic flux vector control, Real sensorless vector control, or vector control, or select the larger inverter and motor capacities. To shorten the deceleration time, use an addition brake unit (FR-BU2) to absorb braking energy, power regeneration common converter (FR-CV), or power supply regeneration unit (MT-RC), etc.

Power transfer mechanisms (reduction gear, belt, chain, etc.)

 Caution is required for the low-speed continuous operation of the motor with an oil lubricated gear box, transmission, reduction gear, etc. in the power transfer mechanism. Such an operation may degrade the oil lubrication and cause seizing. On the other hand, the high-speed operation at more than 60 Hz may cause problems with the noise of the power transfer mechanism, life, or insufficient strength due to centrifugal force, etc. Fully take necessary precautions.

♦ Instructions for overload operation

When performing frequent starts/stops by the inverter, rise/fall in the temperature of the transistor element of the inverter will repeat due to a repeated flow of large current, shortening the life from thermal fatigue. Since thermal fatigue is related to the amount of current, the life can be increased by reducing current at locked condition, starting current, etc. Reducing current may extend the service life but may also cause torque shortage, which leads to a start failure. Adding a margin to the current can eliminate such a condition. For an induction motor, use an inverter of a higher capacity (up to two ranks for the ND rating). For an IPM motor, use an inverter and IPM motor of higher capacities.

Precautions on peripheral device selection

Selection and installation of molded case circuit breaker

Install a molded case circuit breaker (MCCB) on the power receiving side to protect the wiring at the inverter/the converter unit input side. Select an MCCB according to the inverter power supply side power factor, which depends on the power supply voltage, output frequency and load. Refer to page 215. Especially for a completely electromagnetic MCCB, a slightly large capacity must be selected since its operation characteristic varies with harmonic currents. (Check the reference material of the applicable breaker.) As an earth leakage circuit breaker, use the Mitsubishi Electric earth leakage circuit breaker designed for harmonics and surge suppression. (Refer to page 214.) When installing a molded case circuit breaker on the inverter output side, contact the manufacturer of each product for selection.

Handling of the input side magnetic contactor (MC)

For the operation using external terminals (using terminal STF or STR), install the input-side magnetic contactor to prevent accidents due to automatic restart when the power is restored after power failures such as an instantaneous power failure, or for safety during maintenance works. Do not use this magnetic contactor for frequent starting/stopping of the inverter. (The switching life of the converter part is about 1 million times.) In the operation by parameter unit, the automatic restart after power restoration is not performed and the magnetic contactor cannot be used to start the motor. The input-side magnetic contactor can stop the motor. However, the regenerative brake of the inverter does not operate, and the motor coasts to a stop.

Handling of the output side magnetic contactor (MC)

- Switch the MC between the inverter and motor only when both
 the inverter and motor are at a stop. When the magnetic contactor
 is turned ON while the inverter is operating, overcurrent
 protection of the inverter and such will activate. When an MC is
 provided to switch to a commercial power supply, for example, it
 is recommended to use the commercial power supply-inverter
 switchover function Pr.135 to Pr.139.
- Do not install a magnetic contactor at the inverter's output side when using a PM motor.

Installation of thermal relay

In order to protect the motor from overheating, the inverter has an electronic thermal O/L relay. However, install an external thermal overcurrent relay (OCR) between the inverter and motors to operate several motors or a multi-pole motor with one inverter. In this case, set 0 A to the electronic thermal O/L relay setting of the inverter. For the external thermal overcurrent relay, determine the setting value in consideration of the current indicated on the motor's rating plate and the line-to-line leakage current. (Refer to page 221.)

Self cooling ability of a motor reduces in the low-speed operation. Installation of a thermal protector or a use of a motor with built-in thermistor is recommended.

Output side measuring instrument

When the inverter-to-motor wiring length is long, especially for the 400 V class, small-capacity models, the meters and CTs may generate heat due to line-to-line leakage current. Therefore, choose the equipment which has enough allowance for the current rating.

When measuring and displaying the output voltage and output current of the inverter, use of terminals AM and 5 output function of the inverter is recommended.

Disuse of power factor improving capacitor (power factor correction capacitor)

The power factor improving capacitor and surge suppressor on the inverter output side may be overheated or damaged by the harmonic components of the inverter output. Also, since an excessive current flows in the inverter to activate overcurrent protection, do not provide a capacitor and surge suppressor. To improve the power factor, use an AC reactor (on page 191), a DC reactor (on page 192), or a high power factor converter (on page 204).

Connection between the converter unit and the inverter

- Perform wiring so that the commands sent from the converter unit are transmitted to the inverter without fail. Incorrect connection may damage the converter unit and the inverter.
- For the wiring length, refer to the table below.

Total wiring length	Across terminals P and P and terminals N and N	50 m or lower
	Other signal cables	30 m or lower

For the cable gauge of the cable across the main circuit terminals P/+ and N/- (P and P, N and N), refer to **page 216**.

Electrical corrosion of the bearing

When a motor is driven by the inverter, axial voltage is generated on the motor shaft, which may cause electrical corrosion of the bearing in rare cases depending on the wiring, load, operating conditions of the motor or specific inverter settings (high carrier frequency and EMC filter ON). Contact your sales representative to take appropriate countermeasures for the motor.

The following shows examples of countermeasures for the inverter.

- · Decrease the carrier frequency.
- · Turn OFF the EMC filter.
- Provide a common mode choke on the output side of the inverter.*1

(This is effective regardless of the EMC filter ON/OFF connector setting.)

*1 Recommended common mode choke: FT-3KM F series FINEMET® common mode choke cores manufactured by Hitachi Metals, Ltd.

FINEMET is a registered trademark of Hitachi Metals, Ltd.

Cable gauge and wiring distance

If the wiring distance is long between the inverter and motor, during the output of a low frequency in particular, use a large cable gauge for the main circuit cable to suppress the voltage drop to 2% or less. (The table on **page 215** indicates a selection example for the wiring length of 20 m.)

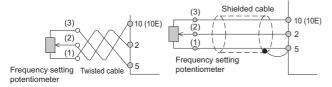

Especially for long-distance wiring or wiring with shielded cables, the inverter may be affected by a charging current caused by stray capacitances of the wiring, leading to an incorrect activation of the overcurrent protective function. Refer to the maximum wiring length shown in the following table. When multiple motors are connected, use the total wiring length shown in the table or shorter (100 m or shorter under vector control and PM sensorless vector control.)

Pr.72 setting (carrier frequency)	FR-A820- 00046(0.4K), FR-A840- 00023(0.4K)	FR-A820- 00077(0.75K), FR-A840- 00038(0.75K)	FR-A820-00105(1.5K) or higher, FR-A840- 00052(1.5K) or higher
2 (2 kHz) or lower	300 m	500 m	500 m
3 (3 kHz) or higher	200 m	300 m	500 m

When the operation panel is installed away from the inverter and when the parameter unit is connected, use a recommended connection cable.

For the remote operation using analog signals, keep the control cable distance between the operation signal transmitter and the inverter to 30 m or less. Also, to prevent induction from other devices, keep the wiring away from the power circuits (main circuit and relay sequential circuit).

When the frequency setting is performed using the external potentiometer, not using the parameter unit, use a shielded or twisted cable as shown in the figure below. Connect the shield cable to terminal 5, not to the earth (ground).

Earth (ground)

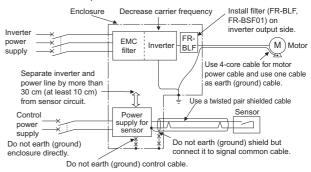

When the inverter is set for the low acoustic noise operation, the leakage current increases compared to in the normal operation due to the high speed switching operation. Always earth (ground) the inverter, the converter unit, and the motor. Also, always use the earth (ground) terminal of the inverter/the converter unit for earthing (grounding). (Do not use a case or chassis.)

Electromagnetic interference (EMI)

For the low acoustic noise operation with high carrier frequency, electromagnetic noise tends to increase. Take countermeasures by referring to the following examples. Depending on an installation condition, noise may affect the inverter also in the normal operation (initial status).

- Decrease the carrier frequency (Pr.72) setting to lower the FMI level
- For countermeasures against the noise in AM radio broadcasting or malfunction of sensors, turn ON the EMC filter. (For the switching method, refer to the Instruction Manual.)
- For effective reduction of induction noise from the power cable of the inverter/the converter unit, secure the distance of 30 cm (at least 10 cm) from the power line and use a shielded twisted pair cable for the signal cable. Do not earth (ground) the shield, and connect the shield to a common terminal by itself.

EMI measure example

leakage current

Capacitances exist between the inverter/the converter unit I/O cables and other cables or the earth, and within the motor, through which a leakage current flows. Since its value depends on the static capacitances, carrier frequency, etc., low acoustic noise operation at the increased carrier frequency of the inverter will increase the leakage current. Therefore, take the following countermeasures. Select the earth leakage circuit breaker according to its rated sensitivity current, independently of the carrier frequency setting.

• To-earth (ground) leakage currents

Туре	Influence and countermeasure
Influence and countermeasure	Leakage currents may flow not only into the inverter/the converter unit's own line but also into the other lines through the earthing (grounding) cable, etc. These leakage currents may operate earth leakage circuit breakers and earth leakage relays unnecessarily. Countermeasure If the carrier frequency setting is high, decrease the Pr.72 PWM frequency selection setting. However, the motor noise increases. Selecting Pr.240 Soft-PWM operation selection makes the sound inoffensive. By using earth leakage circuit breakers designed for harmonic and surge suppression in the inverter's own line and other line, operation can be performed with the carrier frequency kept high (with low noise).
Transmission path	Power supply Leakage breaker NV2 Motor + C Motor +

◆ Line-to-line leakage current

Туре	Influence and countermeasure
Influence and countermeasure	Line-to-line leakage current flows through the capacitance between the inverter/the converter unit output lines. Harmonic component of the leaked current may cause unnecessary operation of an external thermal relay. Long wiring length (50 m or longer) for the 400V class small capacity models (7.5 kW or lower) will increase the rate of leakage current against the rated motor current. In such a case, an unnecessary operation of the external thermal relay may be more liable to occur. Countermeasure Use Pr.9 Electronic thermal O/L relay. If the carrier frequency setting is high, decrease the Pr.72 PWM frequency selection setting. However, the motor noise increases. Selecting Pr.240 Soft-PWM operation selection makes the sound inoffensive. To protect motor securely without being subject to the influence of the line-to-line leakage current, direct detection of the motor temperature using a temperature sensor is recommended.

• Harmonic Suppression Guidelines

Inverters have a converter section (rectifier circuit) and generate a harmonic current.

Harmonic currents flow from the inverter to a power receiving point via a power transformer. The Harmonic Suppression Guidelines was established to protect other consumers from these outgoing harmonic currents.

The three-phase 200 V input specifications 3.7 kW or lower were previously covered by the "Harmonic Suppression Guidelines for Household Appliances and General-purpose Products" and other models were covered by the "Harmonic Suppression Guidelines for Consumers Who Receive High Voltage or Special High Voltage". However, the general-purpose inverter has been excluded from the target products covered by the "Harmonic Suppression Guidelines for Household Appliances and General-purpose Products" in January 2004 and the "Harmonic Suppression Guideline for Household Appliances and General-purpose Products" was repealed on September 6, 2004.

All capacity and all models of general-purpose inverter used by specific consumers are now covered by the "Harmonic Suppression Guidelines for Consumers Who Receive High Voltage or Special High Voltage".

 "Harmonic Suppression Guidelines for Consumers Who Receive High Voltage or Special High Voltage"
 This guideline sets the maximum values of outgoing harmonic currents generated from a high-voltage or specially high-voltage receiving consumer who will install, add or renew harmonic generating equipment. If any of the maximum values is exceeded, this guideline requires that consumer to take certain suppression measures.

The users who are not subjected to the above guidelines do not need follow the guidelines, but the users are recommended to connect a DC reactor and an AC reactor as usual.

Compliance with the "Harmonic Suppression Guidelines for Consumers Who Receive High Voltage or Special High Voltage"

Input power	Target capacity	Countermeasure
Three- phase 200 V		Confirm the compliance with the "Harmonic Suppression Guidelines for Consumers Who Receive High Voltage or Special High Voltage" published in September 1994 by the Ministry of International Trade and Industry (the present Japanese Ministry of Economy, Trade and
Three- phase 400 V	All capacities	Industry). Take countermeasures if required. Use the following materials as reference to calculate the power supply harmonics. Reference materials "Harmonic Suppression Measures of the General-purpose Inverter" January 2004, Japan Electrical Manufacturers' Association "Calculation Method of Harmonic Current of the General-purpose Inverter Used by Specific Consumers" JEM-TR201 (Revised in December 2003), Japan Electrical Manufacturers' Association

For compliance to the "Harmonic Suppression Guideline of the General-purpose Inverter (Input Current of 20A or Less) for Consumers Other Than Specific Consumers" published by JEMA

Input power	Target capacity	Measures
Three- phase 200 V	3.7 kW or lower	Connect the AC reactor or DC reactor recommended in the Catalogs and Instruction Manuals. Reference materials "Harmonic Suppression Guideline of the General-purpose Inverter (Input Current of 20A or Less)" JEM-TR226 (Published in December 2003), Japan Electrical Manufacturers' Association

Calculation of outgoing harmonic current

Outgoing harmonic current = fundamental wave current (value converted from received power voltage) × operation ratio × harmonic content

- Operation ratio: Operation ratio = actual load factor × operation time ratio during 30 minutes
- Harmonic content: Found in the table below.
- Harmonic contents (values when the fundamental wave current is 100%)

Reactor	5th	7th	11th	13th	17th	19th	23rd	25th
Not used	65	41	8.5	7.7	4.3	3.1	2.6	1.8
Used (AC side)	38	14.5	7.4	3.4	3.2	1.9	1.7	1.3
Used (DC side)	30	13	8.4	5.0	4.7	3.2	3.0	2.2
Used (AC, DC sides)	28	9.1	7.2	4.1	3.2	2.4	1.6	1.4

- Indicates the maximum capacity applicable with the Mitsubishi Electric 4-pole standard motor. The power factor may be slightly lower.

 The FR-HEL-110K supports the 200 V class 132 kW motor.

• Overload current rating

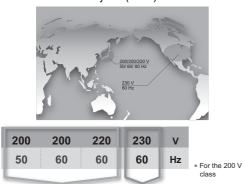

SLD	110% 60 s, 120% 3 s (inverse-time characteristics) at surrounding air temperature of 40°C
LD	120% 60 s, 150% 3 s (inverse-time characteristics) at surrounding air temperature of 50°C
ND	150% 60 s, 200% 3 s (inverse-time characteristics) at surrounding air temperature of 50°C
HD	200% 60 s, 250% 3 s (inverse-time characteristics) at surrounding air temperature of 50°C

• High-performance energy-saving motor superline premium series SF-PR

One motor conforms to the power supply in Japan and the United States.

- The SF-PR series conform to the Top Runner Standard of the "Act on the Rational Use of Energy (energy saving law)" started on April 1, 2015.
- The 230 V 60 Hz motor also conforms to the Energy Independence and Security Act (EISA).

In Japan In the United States

◆ Interchangeable installation size

- Replacement can be smoothly performed because the installation size (frame number) is compatible with our standard efficiency motor SF-JR series
- It is possible to use a power distribution control equipment (thermal relay and breaker), which is the same as a conventional model.

- *1 For the frame number 180 LD or higher and some models of the 6-pole product, the total length or diametrical dimension is greatly different.
- *2 The frame number is different from 1.5 kW6P (112M), 2.2 kW6P(132S) of the SF-HR models.
- *3 When replacing the SF-JR to the SF-PR, it is required to consider upgrading the contactor to secure the same electric durability as using the SF-JR because the electric durability of the contactor may reduce by about 30%. Besides, when replacing the SF-JR to the SF-PR, the existing thermal relay may trip depending on the operating conditions (long starting time). As a countermeasure, consider "Adjusting the heater set value of the thermal" or "Adopting the thermal with a saturated reactor", etc.
- *4 If the breaker NF400-SW manufactured by Mitsubishi Electric is used with the 55 kW motor, change the breaker. (Change the rated current of the breaker NF400-SW from 300 A to 350 A.)

We have released the superline premium series SF-PR models compatible with the Top Runner Standard in Japan, which is equivalent with IE3 premium efficiency for three-phase motors, and with the Energy Independence and Security Act (EISA) in the United States

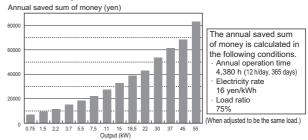

The SF-PR has achieved the efficiency class IE3 with the same dimensions as those of conventional models using our unique technology of the steel plate frame and new core materials. It maintains interchangeability with our standard efficiency motor SF-JR and easy replacement becomes possible.

By adopting a high-efficiency motor, energy savings in plant facilities and reduction of electricity consumption are expected, as well as the effects of recovering the investment cost.

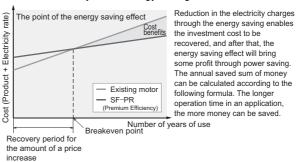

Introduction effects of the superline premium series SF-PR

The SF-PR motor conforms to the Top Runner Standard (IE3 equivalent), which remarkably reduces its operation cost (electricity charges) and greatly contributes minimization of TCO (Total Cost Ownership).

 Trial calculation example of an annual saved sum of money (at upgrading the motor from energy-efficiency class IE1 to IE3) Motor with 4-poles 200 V50 Hz

Economic efficiency on an energy saving effect

<Calculation formula>

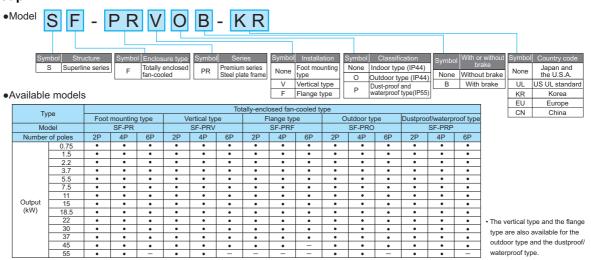

When replacing our standard motor SF-JR with the SF-PR on the ventilation fan in plant

Trial calculation results in replacing the SF-JR with the SF-PR with improved efficiency by 5% under the same conditions of the load factor, operation time, and electricity charges, etc.

◆ Lineup

The SF-PR best matches Mitsubishi Electric inverters

This enables a constant-torque operation in the low-speed range. (expanding the constant-torque

- Combining with the standard motor SF-PR enables a constant-torque operation in the low-speed range.
- The SF-PR has superior performance to the SF-HRCA.
- The 400 V class motors are insulation-enhanced motors as standard.

Combination with Advanced magnetic flux vector control

Enables a constant-torque operation down to 0.5 Hz in a super low-speed range.

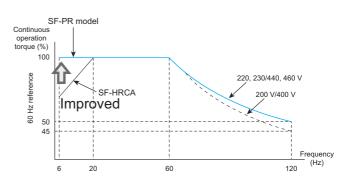

Expanding the constant-torque continuous operation range enables 0.5 to 60 Hz (1: 120) operation.

SF-HRCA model(High-efficiency constant-torque motor) Continuous SF-HR model(High-efficiency motor) torque (%) 100 60 Hz reference 220, 230/440, 460 V 200 V/400 V Significantly expanded 50 45 0.5 120

Combination with V/F control

Enables a constant-torque operation down to 6 Hz in a low-speed

Expanding the constant-torque continuous operation range enables 6 to 60 Hz (1: 10) operation.

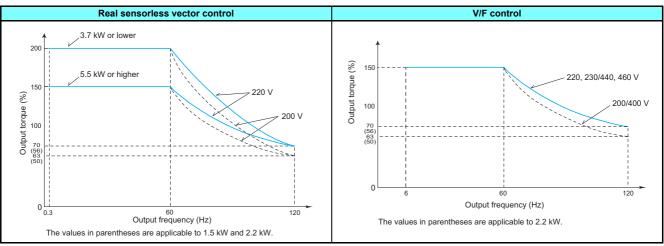

60 Hz torque reference indicates that the rated motor torque is 100% during 60 Hz operation.

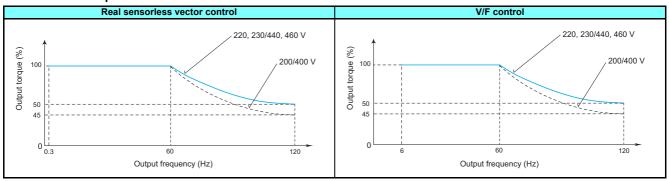

Motor torque

The following shows torque characteristics of the high-performance, energy-saving motor (SF-PR, 4-pole) in combination with an inverter with the ND or HD rating. The overload capacity decreases for the LD or SLD rating. Observe the specified range of the inverter.

Maximum short-time torque

Continuous torque

Mitsubishi Electric high-performance energy-saving motor with encoder superline premium series SF-PR-SC

◆ Fast-response / high-accuracy vector control

Fast-response and high-accuracy vector control can be performed by the use in combination with the general-purpose FR-A800 inverter, plug-in option (FR-A8AP/A8AL), and control terminal option (FR-A8TP).

♦ Wide range of constant-torque characteristics

By selecting vector control, constant-torque continuous operation can be performed in the range from 0 Hz to 60 Hz (zero speed control and servo lock are available).

◆ Energy saving / CO₂ emission reduction

The premium efficiency motor with encoder (compatible with IE3) meets the Top Runner Standard in Japan and the Energy Independence and Security Act (EISA) in the United States.

◆ Compatibility with the inverter

The motor is used in combination with an inverter of the same capacity.

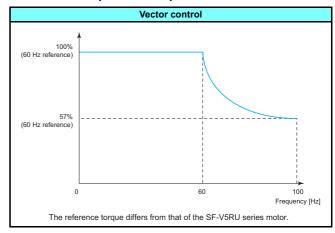

♦ Improved environmental resistance

- Environmental resistance was improved due to the change from the fan cooled type to the blower cooled type. The IP55 compatible motor with an encoder is now also available.
- With the wire-saving design, improved reliability can be obtained.
- Anti-corrosive coating (type 3) is also available.

◆ Motor torque

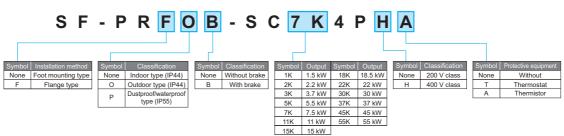

- Excellent speed accuracy
 Speed fluctuation ratio: ±0.01% (for power driving)
- Wide range of speed control Speed control range: 1:1800 (for power driving)

• Continuous operation torque

♦ Lineup

Model

Application to standard motors

Motor loss and temperature rise

The motor operated by the inverter has a limit on the continuous operating torque since it is slightly higher in temperature rise than the one operated by a commercial power supply. At a low speed, reduce the output torque of the motor since the cooling effect decreases. When 100% torque is needed continuously at low speed. consider using a constant-torque motor.

◆ Torque characteristic

The motor operated by the inverter may be less in motor torque (especially starting torque) than the one driven by the commercial power supply. It is necessary to fully check the load torque characteristic of the machine.

Vibration

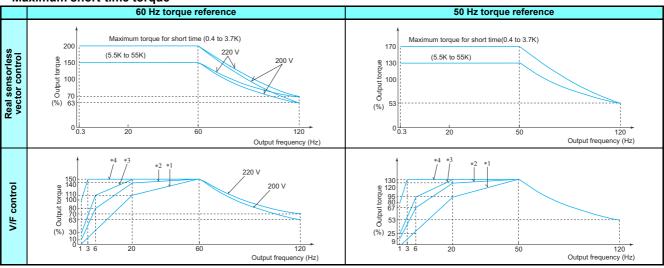

The machine-installed motor operated by the inverter may be slightly greater in vibration than the one driven by the commercial power supply. The possible causes of vibration are as follows.

- Vibration due to imbalance of the rotator itself including the machine
- Resonance due to the natural oscillation of the mechanical system. Caution is required especially when the machine used at constant speed is operated at variable speed. The frequency jump function allows resonance points to be avoided during operation. (During acceleration/deceleration, the frequency within the setting range is passed through.) An effect is also produced if Pr.72 PWM frequency selection is changed. When a two-pole motor is operated at higher than 60 Hz, caution should be taken since such an operation may cause abnormal vibration.

Motor torque

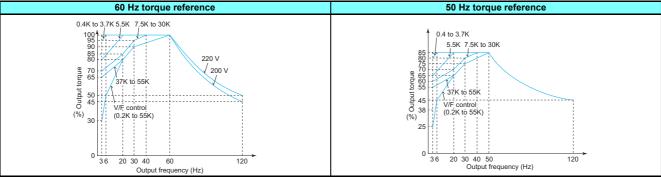

When the Mitsubishi Electric standard squirrel cage motor (SF-JR, 4-pole) and inverter of the same capacity are used, the torque characteristics are as shown below. It is assumed that the motor is used in combination with an inverter with the ND or HD rating. The overload capacity decreases when the LD or SLD rating is selected. Observe the specified range of the inverter.

Maximum short-time torque

- Torque boost minimum (0%)
- Torque boost standard (initial value)
 - Torque boost large
 10%: FR-A820-00046(0.4K), FR-A820-00077(0.75K), FR-A840-00023(0.4K), FR-A840-00038(0.75K) $7\%: FR-A820-00105(1.5K) \ to \ FR-A820-00250(3.7K), \ FR-A840-00052(1.5K) \ to \ FR-A840-00126(3.7K)$ 6%: FR-A820-00340(5.5K), FR-A820-00490(7.5K), FR-A840-00170(5.5K), FR-A840-00250(7.5K) 4%: FR-A820-00630(11K) or higher, FR-A840-00310(11K) or higher
- *4 Torque boost adjustment (3.7 kW or lower)
 The maximum short-time torque indicates the maximum torque characteristics within 60 s.
- Under Real sensorless vector control, 200% (150%) torque (60 Hz torque reference) is output at 0.3 Hz operation.
- A 60 Hz torque reference indicates that the rated torque of the motor running at 60 Hz is 100%, and a 50 Hz torque reference indicates that the rated torque of the motor running at 50 Hz is 100%
- Under V/F control, all of SF-JR 2-pole, 4-pole, and 6-pole motors have the same torque characteristics.

Continuous torque (Real sensorless vector control)

- A general-purpose squirrel cage motor must be used at lower continuous operating torque in rated operation as shown in the chart since the cooling capability of the fan installed on the rotor reduces at a lower speed. (Instantaneous torque occurs.)
- The toque with 200 or 220 V at 60 Hz or 200 V at 50 Hz in the chart indicates a motor torque reference (base frequency set in Pr.3 of the inverter) and is not the frequency of the power supply. In a 50 Hz power supply area, the 60 Hz setting can be set.
- When continuously operating a motor with the 50 Hz torque reference setting, set the load torque to 85% or lower.

Application to constant-torque motors

♦ SF-HRCA type

- Continuous operation even at low speed of 0.3 Hz is possible (when using Real sensorless vector control).
 - For the 37 kW or lower (except for 22 kW), load torque is not needed to be reduced even at a low speed and constant torque (100% torque) continuous operation is possible within the range of speed ratio 1/20 (3 to 60 Hz).
- (The characteristic of motor running at 60 Hz or higher is that output torque is constant.)
- Installation size is the same as that of the standard motor.
- Note that operation characteristic in the chart below cannot be obtained if V/F control is used.

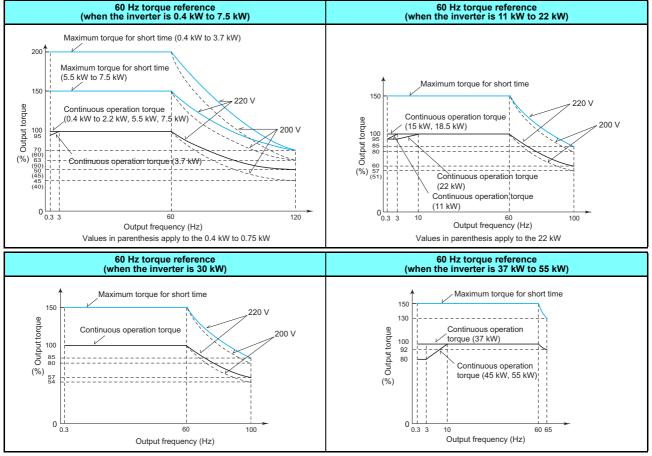

Standard specifications (indoor type)

Output (kW)	Number of poles	Frequency range	Common specification

♦ Motor torque

It is assumed that the motor is used in combination with an inverter with the ND or HD rating. The overload capacity decreases when the LD or SLD rating is selected. Observe the specified range of the inverter.

• Continuous rated range of use (Real sensorless vector control)

The maximum short-time torque indicates the maximum torque characteristics within $60\ s.$

For the motor constant under Real sensorless vector control, please contact your sales representative.

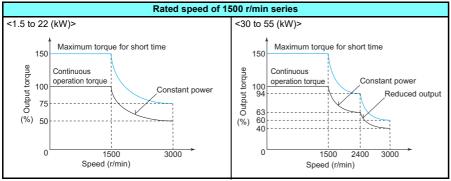

Application to vector control dedicated motors (SF-V5RU) (55 kW or lower)

For performing vector control, the FR-A8AP/FR-A8TP (vector control compatible option) is required. When the FR-A8TP is not used, a 12 V or 24 V power supply is required as the power supply for the encoder of the SF-V5RU. (When the FR-A8TP is used, the 24 V power supply of the FR-A8TP can be used for the encoder of the SF-V5RU.)

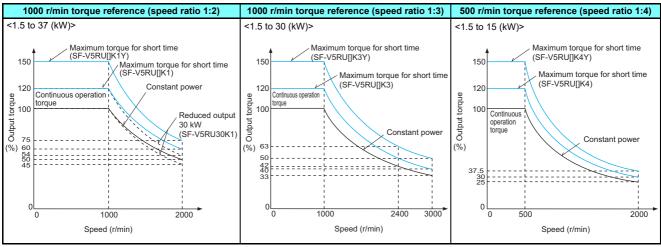

Motor torque

When the vector control dedicated motor (SF-V5RU) and inverter are used, the torque characteristics are as shown below. It is assumed that the motor is used in combination with an inverter with the ND or HD rating. The overload capacity decreases when the LD or SLD rating is selected. Observe the specified range of the inverter.

SF-V5RU

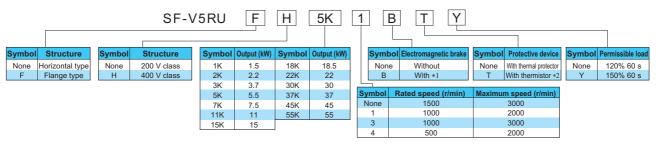

SF-V5RU1, 3, and 4

- The maximum rotation speed of the SF-V5RU-55kW and SF-V5RU3-30kW is 2400 r/min.
- The SF-V5RU-3.7kW or lower can be operated with the maximum rotation speed of 3600 r/min. For the use of those motors, please contact your sales representative.
- The maximum rotation speed of motors with a brake is 1800 r/min.
- The maximum short-time torque of the SF-V5RU[]K1, SF-V5RU[]K3, and SF-V5RU[]K4 is 120%. As the motor compatible with the maximum short-time torque of 150%, specify the SF-V5RU[]K1Y, SF-V5RU[]K3Y, or SF-V5RU[]K4Y.

Motor model

- Since a brake power device is a stand-alone, install it inside the enclosure. (This device should be arranged at the customer side.) To use the thermistor function of the thermistor-equipped motor SF-V5RU [[[][][]]] T, the plug-in option (FR-A8AZ) is required additionally.

- 80% output in the high-speed range. (The output is reduced when the speed is 2400 r/min or more. Contact us separately for details.)

 A dedicated motor of 3.7 kW or less can be run at the maximum speed of 3600 r/min. Consult our sales office when using the motor at the maximum speed.

Power (current) at 50 Hz/60 Hz.

Since a motor with brake has a window for gap check, the protective structure of both the cooling fan section and brake section is IP20. S of IP23S is an additional code indicating the condition that protection from water intrusion is established only when a cooling fan is not operating.

- The value when high carrier frequency is set (Pr.72 = 6, Pr.240 = 0). The 12 V/24 V power supply is required as the power supply for the encoder. (When the FR-A8TP is used, the 24 V power supply of the FR-A8TP can be used for the encoder of the SF-V5RU.)
- The cooling fan is equipped with a thermal protector. The cooling fan stops when the coil temperature exceeds the specified value in order to protect the fan motor. A restrained cooling fan or degraded fan motor insulation could be causes for the rise in coil temperature. The cooling fan re-starts when the coil temperature drops to normal.
- *8 The cooling fan voltage and input values are the basic specifications of the cooling fan alone and free air values. The input value becomes slightly larger when it is rotated by this motor due to an increased workload, but the cooling fan can be used as it is. When preparing a thermal relay at the user side, use the recommended thermal setting.

- Note) 1. Install the motor on the floor and use it with the shaft horizontal.

 2. Leave an enough clearance between the fan suction port and wall to ensure adequate cooling.

 Also, check that the ventilation direction of a fan is from the opposite load side to the
 - load side
 - The 400 V class motor has "-H" at the end of its type name.
 - Since a brake power device is a stand-alone, install it inside the enclosure. (This device should be arranged at the customer side.)

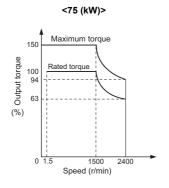

Application to vector control dedicated motors (SF-THY) (75 kW or higher)

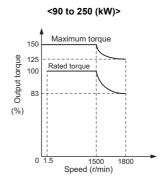

For performing vector control, the FR-A8AP/FR-A8TP (vector control compatible option) is required.

When the FR-A8TP is not used, a 12 V or 24 V power supply is required as the power supply for the encoder of the SF-THY. (When the FR-A8TP is used, the 24 V power supply of the FR-A8TP can be used for the encoder of the SF-THY.)

♦ Motor torque

When the vector control dedicated motor (SF-THY) and inverter of the same capacity are used and rated voltage is input, the torque characteristics are as shown below.

◆ Model lineup

• Rated speed: 1500 r/min (4 poles)

Model	Standard type			Ra	ated output (k)	N)		
wodei	Standard type	75	90	110	132	160	200	250
Standard horizontal type	SF-THY[]	75	90	110	132	160	200	250

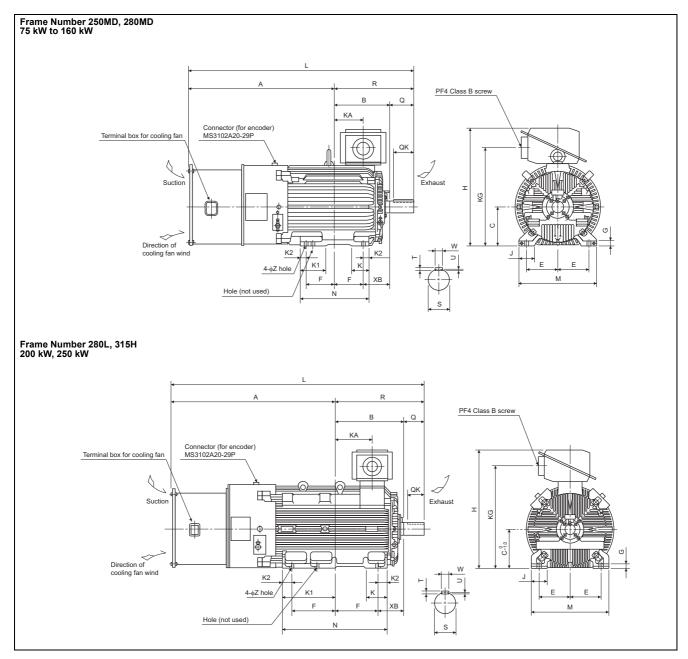

• Both 200 V and 400 V classes have the same model name. Since motors speed ratio, 1:2, 1:3, or 1:4 specifications are available as special products, contact your sales representative.

- When the power supply voltage drops, we cannot guarantee the above output and rated speed.

 When the load torque is 20% of the motor rating. The permissible load inertia moment ratio is smaller when the load torque is larger.

- When the load torque is 20% of the motor rating. The permissible load inertia moment ratio is smaller when the load torque is larger.

 Consult us if the load inertia moment ratio excesseds the above value.

 This does not apply to the shaft through portion.

 Value for the MM-CF[]2C.

 The value for the MM-CF[]2B is indicated in parentheses.

 Set 3150 r/min (210 Hz) or less in **Pr.374 Overspeed detection level**. The inverter may be damaged by the motor induction voltage if the motor speed exceeds 3150 r/min (210 Hz).

PM sensorless vector control, PM parameter initial setting

G	r.	GROUP	Name	Pr.	GROUP	Name
99	8	E430	PM parameter initialization	IPM		IPM initialization

Performing the IPM parameter initialization makes the IPM motor MM-CF ready for PM sensorless vector control. (This function is not available in the FR-A842-P.)

PM sensorless vector control requires the following conditions.

- · The motor capacity is equal to or one rank lower than the inverter capacity.
- Single-motor operation (one motor to one inverter) is preformed.
- The overall wiring length with the motor is 100 m or shorter. (Even with the IPM motor MM-CF, when the wiring length exceeds 30 m, perform offline auto tuning.)

◆ Setting procedure of PM sensorless vector control

Selecting the PM sensorless vector control by the IPM initialization mode

This inverter is set for an induction motor in the initial setting. Follow the following procedure to change the setting for the PM sensorless vector control.

- The parameters required to drive an MM-CF IPM motor are automatically changed as a batch.
- To change to the PM sensorless vector control, perform the following steps before setting other parameters. If the PM sensorless vector control is selected after setting other parameters, some of those parameters will be initialized too. (Refer to "IPM parameter initialization list" for the parameters that are initialized.)

	Operation
1.	Turning ON the power of the inverter The operation panel is in the monitor mode.
2.	Changing the operation mode Press PU to choose the PU operation mode. [PU] indicator is lit.
3.	Selecting the parameter setting mode Press MODE to choose the parameter setting mode. [PRM] indicator is lit.
4.	IPM parameter initialization Turn until / 戸州(IPM parameter initialization) appears.
5.	Displaying the set value Press SET to read the present set value. "[]" (initial value) appears.
6.	Changing the setting value Turn to change the set value to "]] , then press SET. "]] 3 " and " PM" are displayed alternately. The setting is completed.

Setting value	Description				
0	Parameter settings for an induction motor				
3003	Parameter settings for an IPM motor MM-CF (rotations per minute)				

NOTE

- Performing IPM parameter initialization in the parameter setting mode automatically changes the Pr.998PM parameter initialization setting.
- In the initial parameter setting, the capacity same as the inverter capacity is set in **Pr.80 Motor capacity**. To use a motor capacity that is one rank lower than the inverter capacity, set Motor capacity by selecting the mode on the operation panel.
- To set a speed or to display monitored items in frequency, set Pr.998. (Refer to Instruction Manual (Detailed).)

Selecting the PM sensorless vector control by Pr.998

Setting Pr.998 PM parameter initialization as shown in the following table activates PM sensorless vector control.

Pr.998 setting	Description	Operation on IPM parameter initialization
0 (initial value)	Parameter settings for an induction motor (frequency)	I III(IPM) → write "0"
3003	Parameter settings for an IPM motor MM-CF (rotations per minute)	
3103	Parameter settings for an IPM motor MM-CF (frequency)	-
8009	Parameter (rotations per minute) settings for an IPM motor other than MM-CF (after tuning)	-
8109	Parameter (frequency) settings for an IPM motor other than MM-CF (frequency)	-
9009	Parameter (rotations per minute) settings for an SPM motor (after tuning)	-
9109	Parameter (frequency) settings for an SPM motor (after tuning)	-

The S-PM geared motor cannot be driven.

◆ PM parameter initialization list

- The parameter settings in the following table are changed to the settings required to perform PM sensorless vector control by selecting PM sensorless vector control with the IPM parameter initialization mode on the operation panel or with Pr.998 PM parameter initialization.
- · Performing parameter clear or all parameter clear sets back the parameter settings to the settings required to drive an induction motor.

- Initial value for the FR-A820-03160(55K) or lower and FR-A840-01800(55K) or lower Initial value for the FR-A820-03800(75K) or higher and FR-A840-02160(75K) or higher Setting Pr.71 Applied motor = "333, 334, 8093, 8094, 9093, or 9094" does not change the Pr.71 Applied motor setting. When a value other than "9999" is set, the set value is not changed.

 200 r/min when Pr.788 Low speed range torque characteristic selection = "0"

 13.33 Hz when Pr.788 Low speed range torque characteristic selection = "0"

 110% for SLD, 120% for LD, 150% for ND, and 200% for HD (Refer to Pr.570 Multiple rating setting on page 162.)

 Pr.702 Maximum motor frequency is used as the maximum motor frequency (rotations per minute). When Pr.702 = "9999 (initial value)", Pr.84 Rated motor frequency is used as the maximum motor frequency (rotations per minute).

 The setting value is converted from frequency to rotations per minute. (The value after the conversion differs according to the number of motor poles.)

• If IPM parameter initialization is performed in rotations per minute (Pr.998 = "3003, 8009, or 9009"), the parameters not listed in the table and the monitored items are also set and displayed in rotations per minute.

◆ Specification comparison between PM sensorless vector control and induction motor control

Item		PM sensorless vector control (MM-CF)	Induction motor control
Applicable motor		eries (0.5 to 7.0 kW) (Refer to page 239 .) an MM-CF (tuning required) *1	Induction motor *1
	High frequency superposition control	200% (200% for the 1.5 kW or lower with MM-CF, 150% for the 2.0 kW or higher)	200% (FR-A820-00046(0.4K) to FR-A820- 00250(3.7K), FR-A840-00023(0.4K) to FR-A840- 00126(3.7K))
Starting torque	Current synchronization operation	50%	150% (FR-A820-00340(5.5K), FR-A840- 00170(5.5K) or higher) under Real sensorless vector control and vector control
Zero speed	High frequency superposition control	Available (Select the HD rating for zero speed 200%)	Available under Real sensorless vector control
Zero specu	Current synchronization operation	Not available	and vector control
Carrier frequency	High frequency superposition control	6 kHz (Pr.72 = "0 to 9"), 10 kHz (Pr.72 = "10 to 13"), 14 kHz (Pr.72 = "14 or 15") (6 kHz in a low-speed range of 10 kHz or higher. The frequency of 2 kHz is not selectable.)	FR-A820-03160(55K) or lower, FR-A840-01800(55K) or lower : Any value in the range of 0.75 kHz to 14.5 kHz
Carrier frequency	Current synchronization operation	2 kHz (Pr.72 = "0 to 5"), 6 kHz (Pr.72 = "6 to 9"), 10 kHz (Pr.72 = "10 to 13"), 14 kHz (Pr.72 = "14 or 15") (6 kHz in a low-speed range of 10 kHz or higher.)	FR-A820-03800(75K) or higher, FR-A840-02160(75K) or higher : 0.75 kHz to 6 kHz
Automatic restart after instantaneous power failure	No startup waiting tir Using the regeneration recommended.	me. on avoidance function or retry function together is	Startup waiting time exists.
Startup delay	Startup delay of abou	ut 0.1 s for magnetic pole position detection.	No startup delay (when online auto tuning is not performed at startup).
Driving by the commercial power supply	Cannot be driven by	the commercial power supply.	Can be driven by the commercial power supply. (Other than vector control dedicated motor.)
Operation during coasting	While the motor is co	pasting, potential is generated across motor terminals.	While the motor is coasting, potential is not generated across motor terminals.
Torque control	Not available		Available under Real sensorless vector control and vector control
Position control	High frequency superposition control	Available (sensorless)	Available under vector control.
1 control	Current synchronization operation	Not available	Available under vector control.

The motor capacity is equal to or one rank lower than the inverter capacity. (It must be 0.4 kW or higher.) Using a motor with the rated current substantially lower than the inverter rated current will cause torque ripples, etc. and degrade the speed and torque accuracies. As a reference, select the motor with the rated motor current that is about 40% or higher of the inverter rated current.

• NOTE

- Before wiring, make sure that the motor is stopped. Otherwise an electric shock may occur.
 Never connect an IPM motor to the commercial power supply.
- · No slippage occurs with an IPM motor because of its characteristic. If an IPM motor, which took over an induction motor, is driven at the same speed as for the induction motor, the running speed of the IPM motor becomes faster by the amount of the induction motor's slippage. Adjust the speed command to run the IPM motor at the same speed as the induction motor, as required.

Countermeasures against deterioration of the 400 V class motor insulation

When driving a 400 V class motor by the inverter, surge voltages attributable to the wiring constants may occur at the motor terminals, deteriorating the insulation of the motor. When the 400 V class motor is driven by the inverter, consider the following countermeasures:

With induction motor

It is recommended to take one of the following countermeasures:

• Rectifying the motor insulation and limiting the PWM carrier frequency according to the wiring length

For the 400 V class motor, use an insulation-enhanced motor.

The Mitsubishi Electric high-efficiency motor SF-HR, the Mitsubishi Electric constant-torque motor SF-HRCA, and the Mitsubishi Electric high-performance energy-saving motor SF-PR are insulation-enhanced motors as standard. Specifically,

- Order a "400 V class inverter-driven insulation-enhanced motor".
- For the dedicated motor such as the constant-torque motor and low-vibration motor, use an "inverter-driven dedicated motor".
- Set Pr.72 PWM frequency selection as indicated below according to the wiring length.

Inverter	Wiring length 50 m or shorter	Wiring length 50 m to 100 m	Wiring length Longer than 100 m
Standard model	15 (14.5 kHz) or lower	0 (0 kHz) or lower	4 (4 kHz) lower
IP55 compatible model	15 (14.5 kHz) 01 lower	9 (9 kHz) of lower	4 (4 KHZ) lowel
Separated converter type	6 (6 kHz) or lower	6 (6 kHz) or lower	4 (4 kHz) lower

Suppressing the surge voltage on the inverter side

- For FR-A840-01800(55K) or lower, connect a surge voltage suppression filter (FR-ASF-H/FR-BMF-H) at the output side of the inverter.
- For FR-A840-02160(75K) or higher, connect a sine wave filter (MT-BSL/BSC) at the output side of the inverter.

With PM motor

Set Pr.72 PWM frequency selection as indicated below according to the wiring length.

Applicable Inverter	Wiring length				
Applicable inverter	50 m or shorter	50 m to 100 m			
FR-A840-00023(0.4K), 00038(0.75K)	0 (2 kHz) to 15 (14 kHz)	5 (2 kHz) or lower			
Others	0 (2 kHz) to 15 (14 kHz)	9 (6 kHz) or lower			

A surge voltage suppression filter (FR-ASF-H/FR-BMF-H) can be used under V/F control and Advanced magnetic flux vector control.
 A sine wave filter (MT-BSL/BSC) can be used under V/F control. Do not use the filters under unspecified controls.

Application to special motors

♦ Motors with brake

Use the motor with brake having independent power supply for the brake, connect the brake power supply to the inverter primary side power and make the inverter output off using the output stop terminal (MRS) when the brake is applied (motor stop). Rattle may be heard according to the type of the brake in the low speed region but it is not a fault.

Pole changing motor

As this motor differs in rated current from the standard motor, confirm the maximum current of the motor and select the inverter. Be sure to change the number of poles after the motor has stopped. If the number of poles is changed during rotation, the regenerative overvoltage protection circuit may be activated to cause an inverter alarm, coasting the motor to a stop.

Submersible motor

Since the motor rated current is larger than that of the standard motor, make selection of the inverter capacity carefully. In addition, the wiring distance between the motor and inverter may become longer, refer to **page 215** to perform wiring with a cable thick enough. Leakage current may flow more than the land motor, take care when selecting the earth leakage current breaker.

♦ Explosion-proof motor

To drive an explosion-proof type motor, an explosion-proof test of the motor and inverter together is necessary. The test is also necessary when driving an existing explosion-proof motor.

The inverter is a non-explosion proof structure, install it in a safety location.

♦ Geared motor

The continuous operating rotation range of this motor changes depending on the lubrication system and maker. Especially in the case of oil lubrication, continuous operation in the low-speed range only can cause gear seizure. For fast operation at higher than 60 Hz, please consult the motor maker.

Synchronous motor other than PM motor

This motor is not suitable for applications of large load variation or impact, where out-of-sync is likely to occur. Please contact your sales representative when using this motor because its starting current and rated current are greater than those of the standard motor and will not rotate stably at low speed.

Single phase motor

The single phase motor is not suitable for variable operation by the inverter

For the capacitor starting system, the capacitor may be damaged due to harmonic current flowing to the capacitor. For the split-phase starting system and repulsion starting system, not only output torque is not generated at low speed but it will result in starting coil burnout due to failure of centrifugal force switch inside. Replace with a three-phase motor for use.

Compatibility

Major differences from the FR-A700 series

	Item	FR-A700	FR-A800
Control method		V/F control Advanced magnetic flux vector control Real sensorless vector control Vector control (with plug-in option) PM sensorless vector control (IPM motor)	V/F control Advanced magnetic flux vector control Real sensorless vector control Vector control (with plug-in option/control terminal option) PM sensorless vector control (IPM motor/SPM motor)

(b	Brake transistor rake resistor usable)	Built in for the FR-A720-0.4K to 22K Built in for the FR-A740-0.4K to 22K	Built in for the FR-A820-00046(0.4K) to 01250(22K) Built in for the FR-A840-00023(0.4K) to 01800(55K)
	V/F control	400 Hz	590 Hz
Maximum output frequency	Advanced magnetic flux vector control	120 Hz	400 Hz
aximu t freq	Real sensorless vector control	120 Hz	400 Hz
t P	vector control	120 Hz	400 Hz
ъ П	PM sensoriess vector control	300 Hz	400 Hz
PID control		Turn the X14 signal ON to enable PID control.	When the X14 signal is not assigned, just set a value other than "0" in Pr.128 to enable PID control. When the X14 signal is assigned, turn the X14 signal ON while Pr.128 ≠ "0" to enable PID control. The PID pre-charge function and dancer control are added.
	itomatic restart after ntaneous power failure	Turn the CS signal ON to enable restart.	CS signal assignment not required. (Restart is enabled with the Pr.57 setting only.)
	mber of motor poles /F control switching	The V/F switching signal (X18) is valid when Pr.81 = "12 to 20 (2 to 10 poles)".	Pr.81 = "12 (12 poles)" X18 is valid regardless of the Pr.81 setting. (The Pr.81 settings "14 to 20" are not available.)
Р	TC thermistor input	Input from terminal AU (The function of terminal AU is switched by a switch.)	Input from terminal 2. (The function of terminal 2 is switched by the Pr.561 setting.)
	USB connector	B connector	Mini B connector
Contr	ol circuit terminal block	Removable terminal block (screw type)	Removable terminal block (spring clamp type)
Tei	minal response level		e level than the FR-A700's terminals. By setting Pr.289 Inverter output the terminal response level can be compatible with that of FR-A700. Set to cording to the system.
	PU	FR-DU07 (4-digit LED) FR-PU07	FR-DU08 (5-digit LED) FR-LU08 (LCD operation panel) FR-PU07 (Some functions are limited or not available.) FR-DU07 is not supported.
	Plug-in option	Dedicated plug-in options (not interchangeable)	
Co	mmunication option	Connected to the connector 3	Connected to the connector 1
	Installation size	require new mounting holes.)	e for all capacities. (Replacement between the same capacities does not not compatible. (New mounting holes are required.)
	Converter	Built-in for all capacities	An optional converter unit (FR-CC2) is required for separated converter types.
DC reactor		The 75K or higher comes with a DC reactor (FR-HEL).	For the FR-A820-03800(75K) or higher, the FR-A840-02160(75K) or higher, and when a 75 kW or higher motor is used, select a DC reactor suitable for the applicable motor capacity. (A DC reactor is not included.) Separated converter types (converter unit FR-CC2) and IP55 compatible models have a built-in DC reactor.
Brak	e unit (75 kW or higher)	FR-BU2, MT-BU5	FR-BU2
	stallation processti	1	ı

◆ Installation precautions

- Removal procedure of the front cover is different. (Refer to the Instruction Manual.)
- Plug-in options of the FR-A700 series are not compatible.
- Operation panel (FR-DU07) cannot be used.

Wiring precautions

· The spring clamp type terminal block has changed to the screw type. Use of blade terminals is recommended.

◆ Instructions for continuous use of the FR-PU07 (parameter unit) manufactured in September 2015 or

- For the FR-A800 series, many functions (parameters) have been added. When setting these parameters, the parameter names and setting ranges are not displayed.
- Only the parameter with the numbers up to "999" can be read and set. The parameters with the numbers after "999" cannot be read or set.
- Many protective functions have been added for the FR-A800 series. These functions are available, but all faults are displayed as "Fault". When the fault history is checked, "ERR" appears. Added faults will not appear on the parameter unit. (However, MT1 to MT3 are displayed as MT.)
- Parameter copy/verification function are not available.

For information on the restrictions on the purchase of the FR-PU07, refer to the Instruction Manual of the FR-PU07.

Copying parameter settings

The FR-A700 series' parameter settings can be easily copied to the FR-A800 series by using the setup software (FR Configurator2). (Not supported by the setup software FR-SW3-SETUP or older.)

• Comparison with the FR-A700 series in functions

Parameter/function	Addition	Modification	Related parameter	Remarks
Maximum frequency		0	Pr.1 etc.	Max. 590 Hz (Max. 400 Hz under other than V/F control)
Free thermal (electronic thermal O/L relay)	0		Pr.600 to Pr.604, Pr.692 to Pr.696	Thermal characteristics can be freely set.
PTC thermistor		0	Pr.561	The protection level can be set by parameters.
Strengthened excitation deceleration	0		Pr.660 to Pr.662	Loss of the motor is increased to reduce regenerative power.
4 mA input check	0		Pr.573, Pr.777, Pr.778	Loss of 4 mA input is detected.
Input terminal filter	0		Pr.699	The terminal response can be adjusted.
Output terminal filter	0		Pr.289	The terminal response can be adjusted.
Remote output terminal (analog)	0		Pr.655 to Pr.659	Optional analog output
Parameter display by group	0		Pr.Md	The parameters are displayed in the conventional numerical order in the initial state.
Speed smoothing	0		Pr.653, Pr.654	Machine resonance is reduced.
Traverse function	0		Pr.592 to Pr.597	Only speed control is available under vector control.
USB host (USB memory connection)	0		Pr.1049	Parameter read/copy, data logging, execution of the ladder in the USB (PLC function), etc.
Second PID control	0		Pr.753 to Pr.758, Pr.1134, Pr.1135, Pr.1140, Pr.1141, Pr.1143 to Pr.1149	
PID pre-charge function	0		Pr.760 to Pr.769	
PID output suspension function	0		Pr.575 to Pr.577	
PLC function	0		Pr.414 to Pr.417, Pr.498, Pr.1150, Pr.1199	
Maintenance timer		0	Pr.503, Pr.504, Pr.686 to Pr.689	Up to three timers can be set.
Fault initiation	0		Pr.997	Faults can be initiated.
Multiple rating selection	0		Pr.570	The rating can be selected from SLD, LD, ND, or HD.
Fast-response operation selection	0		Pr.800	High response of the vector control, real sensorless vector control, and PM sensorless vector control
24 V external power supply input	0		_	Operation is unavailable. (Communication and parameter setting are available.)
Cooling fan operation selection		0	Pr.244	Waiting time at stop can be changed.
GOT automatic recognition	0		_	The GOT2000 series is supported.
Optimum excitation control mode	0		Pr.60	

Major differences between the standard model (FR-A840) and the separated converter type (FR-A842)

Item	FR-A842	Remarks (FR-A840)

Major differences between the FR-A800 (RS-485 communication model) and the FR-A800-E (Ethernet communication model)

Item	FR-A800 (RS-485 communication model)	FR-A800-E (Ethernet communication model)
Standard equipment	RS-485 terminals	Ethernet connector
Communication	Mitsubishi inverter protocol MODBUS RTU protocol	MODBUS/TCP MELSOFT / FA product connection SLMP iQSS CC-Link IE Field Network Basic
Number of connectable plug-in options	3	2 (initial status)
Optional screw-type terminal block (FR-A8TR)	Can be used.	Cannot be used.

Major differences between the standard inverter and the inverter with parallel operation function

The following functions of the FR-A800 standard inverter are changed in the FR-A842-P.

Function name	Pagarintian
	Description The EWD and REV keys on the engration panel of the clave are disabled.
FWD and REV keys on the operation panel	The FWD and REV keys on the operation panel of the slave are disabled.
Mitsubishi inverter protocol communication	Since RS-485 terminals are used for RS-485 communication between the master and slave inverters, communication using the Mitsubishi inverter protocol through the RS-485 terminals is not available.
MODBUS RTU protocol communication	The MODBUS RTU protocol communication is not available.
Safety stop function	The safety stop function is not supported.
High speed maximum frequency (Pr.18)	The upper limit of the output frequency is 120 Hz. Even if a value higher than 120 Hz is set as a high speed maximum frequency, the setting is fixed to 120 Hz.
Current monitoring reference (Pr.56)	The initial value of Pr.56 varies according to the setting in Pr.1001 Parallel operation selection as follows. • Inverter rated current × Number of the inverters × 0.8 when Pr.1001 = "200 or 300" • Inverter rated current × 0.8 when Pr.1001 = "1 or 2"
Optimum excitation control (Pr.60)	The Optimum excitation control mode (Pr.60 = "9") is not available.
Reference current (Pr.61)	It is determined by the following formula: Inverter rated current × Number of the inverters × 0.8, when Pr.61 = "9999 (initial value)"
Applied motor (Pr.71 (Pr.450))	The electronic thermal relay characteristic when Pr.71 (Pr.450) = "8090, 8093, 8094, 9090, 9093, or 9094" is the same as that the standard motor.
Carrier frequency (Pr.72)	The carrier frequency is fixed at 2 kHz. It cannot be changed using parameters.
PU stop selection (Pr.75)	The setting for PU stop selection (Pr.75) in the slave inverter is invalid. (The setting of Pr.75 in the master inverter is applied to the slave inverter.) • When the STOP/RESET key on PU of the slave inverter is pressed while Pr.75 of the master inverter = "14 to 17 or 114 to 117", the motor decelerates to stop regardless of the inverter's operation mode and the warning "PS" (PU stop) indication appears on the slave inverter. The "PS" can be reset on the master inverter. • When Pr.75 of the master inverter = "0 to 3, 100 to 103", the motor does not stop by pressing the STOP/RESET key on the PU of the slave inverter even if the inverters are in the PU operation mode.
Auto tuning setting/status (Pr.96)	Tuning is not available although "101" (offline tuning with motor rotation) is set in Pr.96 .
PID action selection (Pr.128 (Pr.753))	When Pr.128 (Pr.753) of the slave inverter ≠ "2000, 2001, 2010, or 2011", the PID action selection function of the slave inverter is invalid.
Bypass selection at a fault (Pr.138)	Setting "1" in Pr.138 of the master inverter enables automatic switchover to commercial power supply operation when a protective function (E.OHT or E.CPU) is activated in the slave inverter. Install a thermal relay to the master inverter to protect the motor from overheating.
Output current detection level (Pr.150), Zero current detection level (Pr.152)	The result of the following formula corresponds to "100" (100%) of Pr.150 (Output current detection level) and Pr.152 (Zero current detection level) in the master inverter: Inverter rated current × Number of the inverters × 0.8.
Fast-response current limit (Pr.156)	This function is not available.
Frequency setting / key lock operation selection (Pr.161)	Regardless of the Pr.161 setting of the slave inverter, the setting dial frequency setting mode and setting dial potentiometer mode are disabled on the slave inverter. (The function to lock the operation panel keys is available.)
Automatic restart after instantaneous power failure selection (Pr.162)	Even when a value other than "3 or 13" is set in Pr.162 , a frequency search (reduced impact restart) is performed.
Slip compensation (Pr.245 to Pr.247)	To use the slip compensation function, set the motor capacity in Pr.80 (Pr.453) of the master in advance.
Self power management selection (Pr.248)	When "2" is set in Pr.248 of the master inverter, the MC1 signal turns OFF when the circuit failure protective function or E.PA1/E.PA2 (Parallel operation slave 1 fault / Parallel operation slave 2 fault) is activated.
High-speed setting maximum current (Pr.271), Middle-speed setting minimum current (Pr.272)	During operation with the X19 signal ON, when the average current of the current averaging range becomes equal to or less than the result of the following formula 1: Inverter rated current × Number of the inverters × 0.8 × Pr.271 setting (%), the maximum frequency is automatically defined as the setting of Pr.4 Multi-speed setting (high speed). During operation with the X19 signal ON, when the average current of the current averaging range becomes equal to or more than the result of the following formula 2: Inverter rated current × Number of the inverters × 0.8 × Pr.272 setting (%), the maximum frequency is automatically defined as the setting of Pr.5 Multi-speed setting (middle speed). When the average current is more than the result of the formula 1 and less than the result of the formula 2, linear compensation is performed.
Stop mode selection at communication error (Pr.502), Operation frequency during communication error (Pr.779)	The settings of Pr.502 and Pr.779 does not affect communication between the inverters via the RS-485 terminals. (The setting affects only communication via the communication option.)
PU mode operation command source selection (Pr.551)	The command source is the PU connector when Pr.551 = "1" and the inverters are in the PU operation mode. When a USB memory device is connected to the USB connector, the command source is the USB connector.
Multiple rating setting (Pr.570)	The SLD and HD ratings are not supported. When "0 or 3" is set in Pr.570 , the ND rating is applied.
Control method selection (Pr.800 (Pr.451))	The PM sensorless vector control is not available. When Pr.800 (Pr.451) = "13, 14, 113, or 114", Real sensorless vector control is applied.
Fast-response operation (Pr.800 (Pr.451))	Even if the fast-response operation is selected in Pr.800 (Pr.451), the normal-response operation is applied.

Warranty

When using this product, make sure to understand the warranty described below.

1. Warranty period and coverage

We will repair any failure or defect (hereinafter referred to as "failure") in our FA equipment (hereinafter referred to as the "Product") arisen during warranty period at no charge due to causes for which we are responsible through the distributor from which you purchased the Product or our service provider. However, we will charge the actual cost of dispatching our engineer for an on-site repair work on request by customer in Japan or overseas countries. We are not responsible for any on-site readjustment and/or trial run that may be required after a defective unit are repaired or replaced.

[Term]

The term of warranty for Product is twelve months after your purchase or delivery of the Product to a place designated by you or eighteen months from the date of manufacture whichever comes first ("Warranty Period"). Warranty period for repaired Product cannot exceed beyond the original warranty period before any repair work.

[Limitations]

- (1) You are requested to conduct an initial failure diagnosis by yourself, as a general rule. It can also be carried out by us or our service company upon your request and the actual cost will be charged. However, it will not be charged if we are responsible for the cause of the failure.
- (2) This limited warranty applies only when the condition, method, environment, etc. of use are in compliance with the terms and conditions and instructions that are set forth in the instruction manual and user manual for the Product and the caution label affixed to the Product.
- (3) Even during the term of warranty, the repair cost will be charged on you in the following cases;
 - 1) a failure caused by your improper storing or handling, carelessness or negligence, etc., and a failure caused by your hardware or software problem
 - 2) a failure caused by any alteration, etc. to the Product made on your side without our approval
 - a failure which may be regarded as avoidable, if your equipment in which the Product is incorporated is equipped with a safety device required by applicable laws and has any function or structure considered to be indispensable according to a common sense in the industry
 - 4) a failure which may be regarded as avoidable if consumable parts designated in the instruction manual, etc. are duly maintained and replaced
 - 5) any replacement of consumable parts (condenser, cooling fan, etc.)
 - 6) a failure caused by external factors such as inevitable accidents, including without limitation fire and abnormal fluctuation of voltage, and acts of God, including without limitation earthquake, lightning and natural disasters
 - 7) a failure generated by an unforeseeable cause with a scientific technology that was not available at the time of the shipment of the Product from our company
 - 8) any other failures which we are not responsible for or which you acknowledge we are not responsible for

2. Term of warranty after the stop of production

- (1) We may accept the repair at charge for another seven (7) years after the production of the product is discontinued. The announcement of the stop of production for each model can be seen in our Sales and Service, etc.
- (2) Please note that the Product (including its spare parts) cannot be ordered after its stop of production.

3. Service in overseas

Our regional FA Center in overseas countries will accept the repair work of the Product; however, the terms and conditions of the repair work may differ depending on each FA Center. Please ask your local FA center for details.

4. Exclusion of loss in opportunity and secondary loss from warranty liability

Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:

- (1) Damages caused by any cause found not to be the responsibility of Mitsubishi.
- (2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.
- (3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.
- (4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

5. Change of Product specifications

Specifications listed in our catalogs, manuals or technical documents may be changed without notice.

6. Application and use of the Product

- (1) For the use of our product, its applications should be those that may not result in a serious damage even if any failure or malfunction occurs in product, and a backup or fail-safe function should operate on an external system to product when any failure or malfunction occurs.
- (2) Our product is designed and manufactured as a general purpose product for use at general industries. Therefore, applications substantially influential on the public interest for such as atomic power plants and other power plants of electric power companies, and also which require a special quality assurance system, including applications for railway companies and government or public offices are not recommended, and we assume no responsibility for any failure caused by these

In addition, applications which may be substantially influential to human lives or properties for such as airlines, medical treatments, railway service, incineration and fuel systems, man-operated material handling equipment, entertainment machines, safety machines, etc. are not recommended, and we assume no responsibility for any failure caused by these applications when used. We will review the acceptability of the abovementioned applications, if you agree not to require a specific quality for a specific application. Please contact us for consultation.

Available services

Technical consultation (engineering)

Our Japanese and/or local staff offer technical advice, and can also propose the best products and systems for a customer's specific application needs.

From basic operations to applied programming, our training schools offer regular courses that use actual machines. We also offer customized training programs and onsite training sessions.

Showrooms

The latest automation technologies. including programmable controllers, HMIs, inverters, servo systems, and industrial automation machinery such as electrical-discharge machines, laser processing machines, CNCs, and industrial robots can be seen at Mitsubishi Electric showrooms.

Technical support

Our FA centers and service shops work together to provide repairs, onsite engineering support, and spare parts.

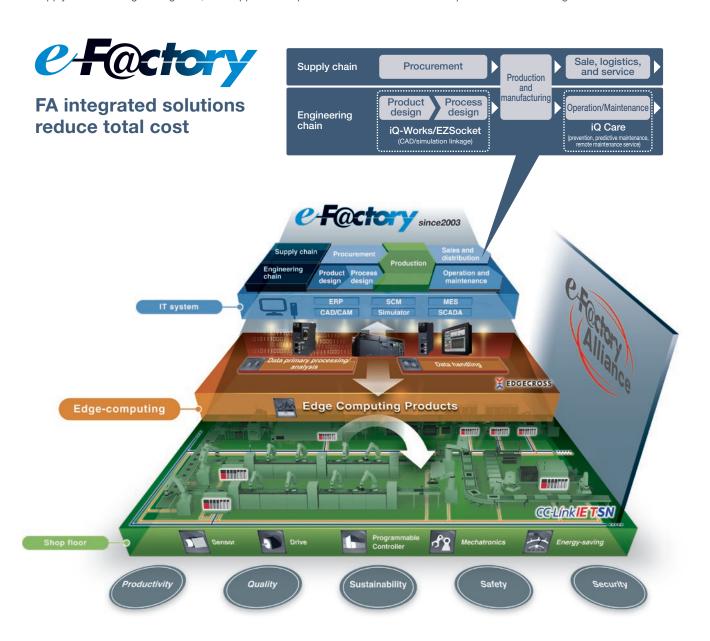

Handle repairs of our FA products.

This solution solves customers' issues and concerns by enabling visualization and analysis that lead to improvements and increase availability at production sites.

Utilizing our FA and IT technologies and collaborating with e-F@ctory Alliance partners, we reduce the total cost across the entire supply chain and engineering chain, and support the improvement initiatives and one-step-ahead manufacturing of our customers.

Overall production information is captured in addition to energy information, enabling the realization of efficient production and energy use (energy savings).

DeviceNet is a trademark of the ODVA, PROFIBUS is a trademark of the PROFIBUS User Organization, and MODBUS is a registered trademark of SCHNEIDER ELECTRIC USA, INC.

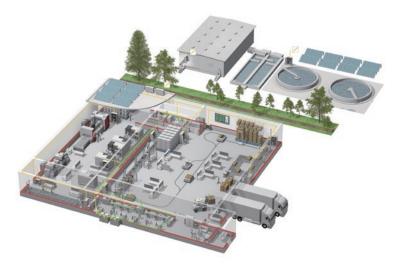

Ethernet is a registered trademark of Fuji Xerox Corporation in Japan.

Windows and Windows Vista are registered trademarks of Microsoft Corporation in the United States and other countries. Other company and product names herein are the trademarks and registered trademarks of their respective owners.

▲ Safety Warning

To ensure proper use of the products listed in this catalog, please be sure to read the instruction manual prior to use.

YOUR SOLUTION PARTNER

Mitsubishi Electric offers a wide range of automation equipment from PLCs and HMIs to CNC and EDM machines.

Low voltage: MCCB, MCB, ACB

Medium voltage: VCB, VCC

Power monitoring, energy management

Compact and Modular Controllers

Inverters, Servos and Motors

Visualisation: HMIs

Numerical Control (NC)

Robots: SCARA, Articulated arm

Processing machines: EDM, Lasers, IDS

Transformers, Air conditioning, Photovoltaic systems

A NAME TO TRUST

Since its beginnings in 1870, some 45 companies use the Mitsubishi name, covering a spectrum of finance, commerce and industry.

The Mitsubishi brand name is recognized around the world as a symbol of premium quality.

Mitsubishi Electric Corporation is active in space development, transportation, semi-conductors, energy systems, communications and information processing, audio visual equipment and home electronics, building and energy management and automation systems, and has 237 factories and laboratories worldwide in over 121 countries.

This is why you can rely on Mitsubishi Electric automation solution - because we know first hand about the need for reliable, efficient, easy-to-use automation and control in our own factories.

As one of the world's leading companies with a global turnover of over 4 trillion Yen (over \$40 billion), employing over 100,000 people, Mitsubishi Electric has the resource and the commitment to deliver the ultimate in service and support as well as the best products.

^{*} Not all products are available in all countries.

Mitsubishi Electric Corporation Nagoya Works is a factory certified for ISO14001 (standards for environmental management systems)and ISO9001(standards for quality assurance management systems)
