

MELSERVO

Servo Amplifiers and Motors

Beginners Manual

MR-J4-A(-RJ)/A4(-RJ)
MR-J4-B(-RJ)/B4(-RJ)
MR-J4W-B

About This Manual

The texts, illustration, diagrams and examples in this manual are provided for information purposes only. They are intended as aids to help explain the installation, operation, programming and use of the servo drives and amplifiers of the series MELSERVO J4-A, MELSERVO J4-B and MELSERVO J4W-B.

If you have any questions about the installation and operation of any of the products described in this manual please contact your local sales office or distributor (see back cover). You can find the latest information and answers to frequently asked questions on our website at www.mitsubishi-automation.com.

MITSUBISHI ELECTRIC EUROPE BV reserves the right to make changes to this manual or the technical specifications of its products at any time without notice.

**Beginners manual for servo amplifiers
series MR-J4-A, MR-J4-B and MR-J4W-B

Safety Guidelines

General safety information and precautions

For use by qualified staff only

This manual is only intended for use by properly trained and qualified electrical technicians who are fully acquainted with the relevant automation technology safety standards. All work with the hardware described, including system design, installation, configuration, maintenance, service and testing of the equipment, may only be performed by trained electrical technicians with approved qualifications who are fully acquainted with all the applicable automation technology safety standards and regulations. Any operations or modifications to the hardware and/or software of our products not specifically described in this manual may only be performed by authorised MITSUBISHI ELECTRIC staff.

Proper use of the products

The amplifiers of the MELSERVO J4 series are only intended for the specific applications explicitly described in this manual. All parameters and settings specified in this manual must be observed. The products described have all been designed, manufactured, tested and documented in strict compliance with the relevant safety standards. Unqualified modification of the hardware or software or failure to observe the warnings on the products and in this manual may result in serious personal injury and/or damage to property. Only peripherals and expansion equipment specifically recommended and approved by MITSUBISHI ELECTRIC may be used in combination with amplifiers of the MELSERVO J4 series.

All and any other uses or application of the products shall be deemed to be improper.

Relevant safety regulations

All safety and accident prevention regulations relevant to your specific application must be observed in the system design, installation, configuration, maintenance, servicing and testing of these products. The regulations listed below are particularly important in this regard.

This list does not claim to be complete, however; you are responsible for being familiar with and conforming to the regulations applicable to you in your location.

● VDE Standards

- VDE 0100
Regulations for the erection of power installations with rated voltages below 1000 V
- VDE 0105
Operation of power installations
- VDE 0113
Electrical installations with electronic equipment
- VDE 0160
Electronic equipment for use in power installations
- VDE 0550/0551
Regulations for transformers
- VDE 0700
Safety of electrical appliances for household use and similar applications
- VDE 0860
Safety regulations for mains-powered electronic appliances and their accessories for household use and similar applications.

- Fire safety regulations
- Accident prevention regulations
 - VBG Nr.4
Electrical systems and equipment

Safety warnings in this manual

In this manual warnings that are relevant for safety are identified as follows:

DANGER:

Failure to observe the safety warnings identified with this symbol can result in health and injury hazards for the user.

WARNING:

Failure to observe the safety warnings identified with this symbol can result in damage to the equipment or other property.

Failure to observe notes can result in serious consequences too. To prevent injury of persons all safety and accident prevention regulations must be observed.

NOTES

means that incorrect handling can result in misoperation of servo amplifier and motor. However failure to observe notes does not result in health and injury hazards for the user or damage to the equipment or other property.

Note also indicates a different setting of parameters, a different function or a different use or provides information about the use of peripherals and expansion equipment respectively

Compliance with EC directives

EU directives exist to facilitate free trade within the EU. They lay down "fundamental protective regulations" to ensure the removal of technical barriers to trade between the EU member states. In the member states of the EU basic safety requirements and the qualifications for bearing the CE mark are regulated by the Machinery Directive (in force since January 1995), the EMC Directive (in force since January 1996) and the Low Voltage Directive (in force since January 1997).

Conformity with the EU directives is demonstrated with a declaration of conformity and displaying the CE mark on the product, its packaging or its operating manual.

The directives listed above apply to appliances, machinery and systems but not to individual components, unless the components perform a direct function for the end user. Since a servo amplifier must be installed together with a servo motor, a control device and other mechanical parts to perform a useful function for the end user, servo amplifiers cannot be said to perform such a direct function. This means that they can be declared as complex components for which a declaration of conformity and the CE mark are not required. This opinion is also upheld by CEMEP, the European Committee of Manufacturers of Electrical Machines and Power Electronics.

However, the servo amplifiers do fulfil the requirements for the CE mark for the machines or accessories in which the servo amplifiers are deployed, in accordance with the Low Voltage Directive. In order to help users ensure conformity with the EMC Directive Mitsubishi Electric has published a manual titled EMC Installation Guidelines (Art. no. 103944), which describes the proper installation of the servo amplifiers, construction of the switchgear cabinet and other important installation tasks. Please contact your dealer for this publication.

Specific safety information and precautions

The following safety precautions are intended as a general guideline for using PLC systems together with other equipment. These precautions must always be observed in the design, installation and operation of all control systems.

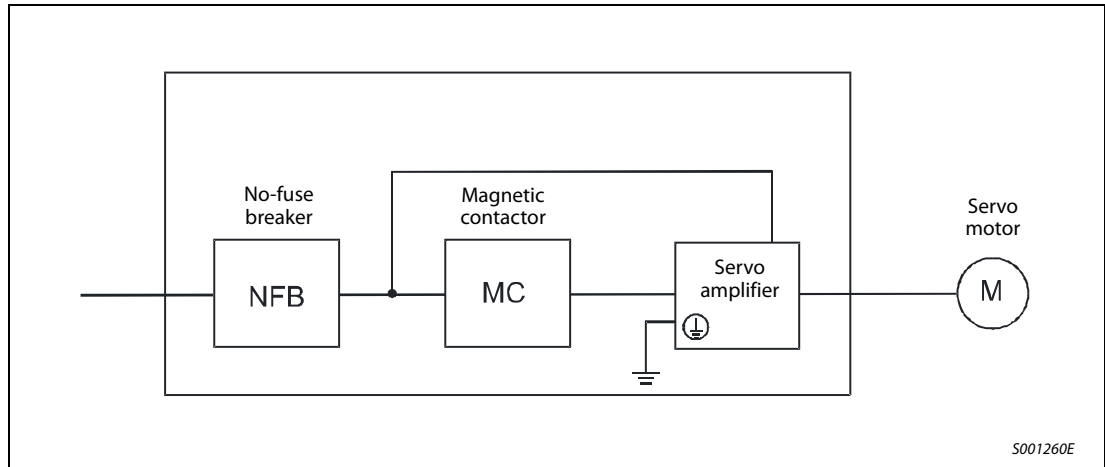

**DANGER:**

- *Observe all safety and accident prevention regulations applicable to your specific application. Always disconnect all power supplies before performing installation and wiring work or opening any of the assemblies, components and devices.*
- *Before installation, wiring and opening of modules, components and devices, switch power off and wait for more than 15 minutes. Then, confirm the voltage is safe with a voltage tester. Otherwise, you may get an electric shock.*
- *Take safety measures, e.g. provide covers, to prevent accidental contact of hands and parts (cables, etc.) with the servo amplifier heat sink, regenerative resistor, servo motor, etc. since they may be hot while power is on or for some time after power-off. Their temperatures may be high and you may get burnt or a parts may be damaged.*
- *Assemblies, components and devices must always be installed in a shockproof housing fitted with a proper cover and fuses or circuit breakers.*
- *Devices with a permanent connection to the mains power supply must be integrated in the building installations with an all-pole disconnection switch and a suitable fuse.*
- *Ground the servo amplifier and servo motor securely.*
- *Check power cables and lines connected to the equipment regularly for breaks and insulation damage. If cable damage is found immediately disconnect the equipment and the cables from the power supply and replace the defective cabling.*
- *Before using the equipment for the first time check that the power supply rating matches that of the local mains power.*
- *EMERGENCY OFF facilities conforming to EN 60204/IEC 204 and VDE 0113 must remain fully operative at all times and in all PLC operating modes. The EMERGENCY OFF facility reset function must be designed so that it cannot ever cause an uncontrolled or undefined restart.*
- *Configure the electromagnetic brake circuit so that it is activated by the EMERGENCY OFF facility.*
- *Residual current protective devices pursuant to DIN VDE Standard 0641 Parts 1-3 are not adequate on their own as protection against indirect contact for installations with PLC systems. Additional and/or other protection facilities are essential for such installations.*
- *If your application requires by installation standards an RCD (residual current device) as up stream protection please select the type B according to DIN VDE 0100-530.*
- *During power-on or operation, do not open the front cover of the servo amplifier. You may get an electric shock.*
- *Do not operate the servo amplifier with the front cover removed. High-voltage terminals and charging area are exposed and you may get an electric shock.*
- *Except for wiring or periodic inspection, do not remove the front cover even of the servo amplifier if the power is off. The servo amplifier is charged and you may get an electric shock.*
- *To avoid an electric shock, insulate the connections of the power supply terminals.*

Specific safety precautions**WARNING:**

- ***Install the servo equipment with full consideration of heat generation during operation. Leave specified clearances between the servo amplifier and control box inside walls or other equipment. Take measures to prevent the internal temperature of the control box from exceeding the environmental conditions.***
- ***Do not install the servo amplifier, servo motor and regenerative resistor on or near combustibles. Otherwise a fire may cause.***
- ***When using servo drives always ensure that all electrical and mechanical specifications and requirements are observed exactly.***
- ***Always connect a magnetic contactor between the power supply and the main circuit power supply (L1, L2, and L3) of the servo amplifier, in order to configure a circuit that shuts down the power supply on the side of the servo amplifier's power supply. If a magnetic contactor is not connected, continuous flow of a large current may cause a fire when the servo amplifier malfunctions.***
- ***When the servo amplifier, the servo motor or the regenerative option has become faulty, switch off the main servo amplifier power side. Continuous flow of a large current may cause a fire.***
- ***Provide an external emergency stop circuit to ensure that operation can be stopped and power switched off immediately.***

Structure

Environment

Operate the servo amplifier at or above the contamination level 2 set forth in IEC60664-1. For this purpose, install the servo amplifier in a control box which is protected against water, oil, carbon, dust, dirt, etc. (IP54).

Grounding

To prevent an electric shock, always connect the protective earth (PE) terminals of the servo amplifier to the protective earth (PE) of the control box. Do not connect two or more ground cables to the same protective earth (PE) terminal. Always connect the cables to the terminals one-to-one.

Typographic Conventions

Use of notes

Notes containing important information are clearly identified as follows:

NOTE

| Note text

Use of examples

Examples containing important information are clearly identified as follows:

Example ▽

Example text

Numbering in figures and illustrations

Reference numbers in figures and illustrations are shown with white numbers in a black circle and the corresponding explanations shown beneath the illustrations are identified with the same numbers, like this:

① ② ③ ④

Procedures

In some cases the setup, operation, maintenance and other instructions are explained with numbered procedures. The individual steps of these procedures are numbered in ascending order with black numbers in a white circle, and they must be performed in the exact order shown:

- ① Text.
- ② Text.
- ③ Text.

Footnotes in tables

Footnote characters in tables are printed in superscript and the corresponding footnotes shown beneath the table are identified by the same characters, also in superscript.

If a table contains more than one footnote, they are all listed below the table and numbered in ascending order with black numbers in a white circle, like this:

- ① Text
- ② Text
- ③ Text

Writing conventions and guidance notes

Keys or key-combinations are indicated in square brackets, such as [Enter], [Shift] or [Ctrl]. Menu names of the menu bar, of the drop-down menus, options of a dialogue screen and buttons are indicated in italic bold letters, such as the drop down menu ***New*** in the ***Project*** menu.

1 Introduction

This english document is the original instruction.

1.1 What is a servo amplifier?

1.1.1 The servo amplifier in the motion control system

Servo amplifiers are components of a so-called motion control system. This concept represents different types of motion control such as single-axis positioning in micro-installations but also for the solution of sophisticated tasks like multiple-axis positioning in large-scale installations. With a motion control system you are able to solve different positioning applications from positioning with one axis in small production lines up to multi axis positioning in large-scale systems.

The Motion CPU controls different more or less complex motion sequences via the connected servo amplifiers and motors.

Typical applications of a motion control systems are:

- Plastics and textile processing,
- Packaging,
- Printing and paper converting,
- Forming,
- Wood and glass working,
- Production of semiconductors

The following diagram shows the components of a motion control system with CPUs, modules, servo amplifiers and motors.

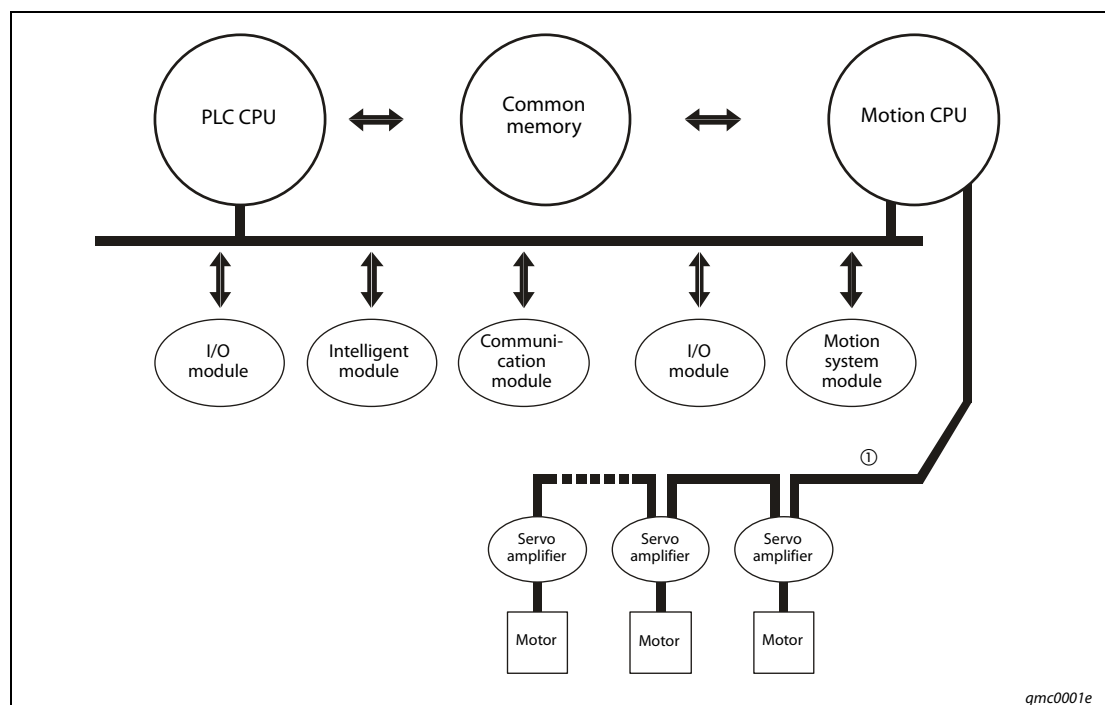

Fig. 1-1: Block diagram of a motion control system

① The bus system for control depends on the used servo amplifier series MR-J4-□A, MR-J4-□B or MR-J4W□-□B.

1.1.2 Function of a servo amplifier

Servo amplifiers are specially designed frequency inverters for driving servo motors for dynamic movements.

The block diagram in fig. 1-2 shows the two main components:

- the power rail (top) and
- the electronics for control and monitoring (bottom).

The power supply loads the capacitor C of the current source via the rectifier with a DC voltage U_z . The power inverter generates from this DC voltage U_z a 3-phase AC voltage with variable frequency to drive the servo motor. In the case, the drive works as a brake, the brake chopper inside the current source limits the voltage U_z and dissipates the braking energy via the resistor R by heat. If there is needed a higher dissipation of braking energy or if the brake events are more frequent, an external resistor R is used to remove a higher quantity of heat.

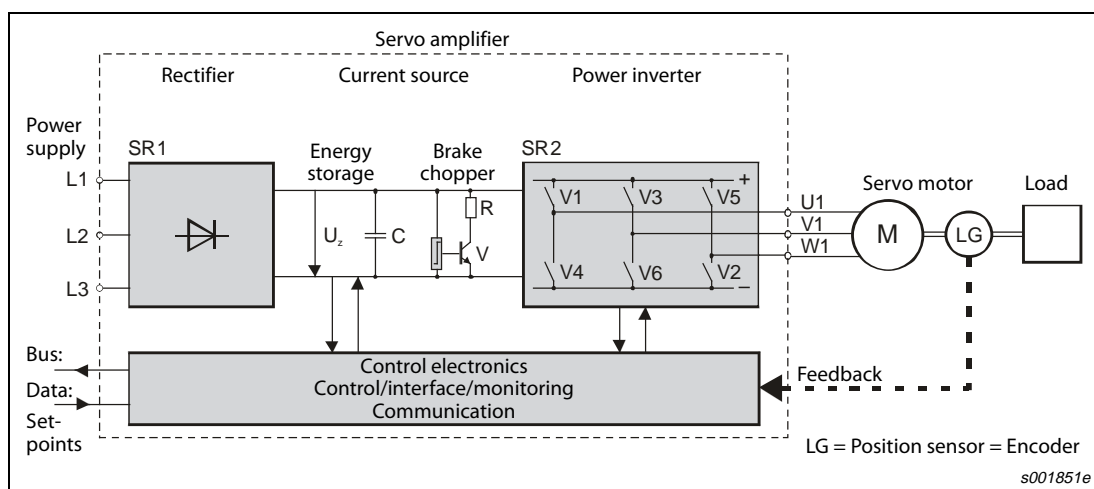

Fig. 1-2: Block diagram of a servo amplifier

1.1.3 Servo motors

Today servo motors are generally used to execute high dynamic movements. The motors work on the principle of a synchronous machine, which is permanently magnetic excited (rotary servo motor).

The motors provide the torque or the power directly and are extremely effective in doing so. Driven by servo amplifiers they work at variable, process-optimizing speed and do precise positioning without delay for the machine. An encoder (position sensor) on the motor shaft reports the position of the rotor back to the servo amplifier. To fix the reached position even in the event of power failure, the motors are equipped with an optional electromagnetic brake. This ensures an perfect adaptation to every needed application (e.g. hanging loads).

The cabling of the power supply of the motor and of the encoder is done by pre-assembled cables. Most of the connections are done with connectors so that the cabling is easy, quick and safe.

Among the rotary servo motors the MR-J4 series servo amplifier is additionally able to operate linear servo motors and direct drive servo motors as standard.

Linear servo motor

A linear servo motor is an AC asynchronous linear motor that works by the same general principles as other induction motors but is designed to directly produce motion in a straight line. Instead of producing a torque (by rotation) it produces a force by a moving linear magnetic field acting on conductors in the field. The most common mode of operation is as a Lorentz-type actuator, in which the applied force is linearly proportional to the current and the magnetic field.

Direct drive servo motor

If a high torque is needed in a special application by using a conventional motor, this requirement can only be solved by using a gear or belt reduction system. Such mechanical reduction systems increase torque but accuracy and repeatability will be reduced by backlash and friction.

The direct drive servo motor is gearless so it eliminates friction from its power transmission. They are suitable for low-speed and high-torque operation. Since the absolute position encoder is coupled directly to the load, system accuracy and repeatability are greatly increased and backlash is eliminated.

1.1.4 Features of servo amplifiers and motors of the MELSERVO J4 series

The motion CPU controls the connected servo amplifiers which drive the servo motors for movement and position. The servo motor is tuned to a certain shaft position, direction of rotation, speed or a certain torque.

All servo motors from the MELSERVO J4 series are equipped by default with a single-turn absolute position encoder. Due to the high encoder resolution of up to 4,194,304 pulses per revolution (22 bit), accurate positioning and high speed stability are possible. The encoder is rigidly coupled to the motor shaft of the servo motor and gives the motor shaft position via the encoder cable back to the servo amplifier (actual position value). The servo amplifier controls position deviations by comparing the actual position value and the position setpoint (command value of the motion CPU). This position deviation or error is also called droop pulse.

By connecting a buffer battery to the servo amplifier, the reference position of the servo motor, also called zero position or home position, can be stored. By supplying the memory with the battery voltage the data of the reference position are kept in the servo amplifier even if the power supply to the servo amplifier fails, is switched off or in case of an alarm. This function is called absolute position detection system.

You can connect the servo amplifier to a PC for configuration. For this purpose Mitsubishi offers the setup software "MR Configurator2". The connection between servo amplifier and PC is done by the built-in USB interface (MR-J4-A, MR-J4-B and MR-J4W-B) and additionally by RS-422 interface (only MR-J4-A).

The MR-J4-A servo amplifiers were developed for multiple applications and are equipped with inputs for analog and pulse signals. MR-J4-B and MR-J4W-B servo amplifiers with SSCNET III/H bus network are designed for operation with Mitsubishi motion controllers of MELSEC System Q.

The MR-J4-A-RJ servo amplifier has a built-in positioning function (point table and program methods, and indexer positioning operation). A simple positioning system can be configured without a controller such as positioning module.

The SSCNET III/H bus system is an optical communication system with serial data exchange via optical fibre optics based on light. This optical bus system offers high transmission speed and cannot be influenced by electromagnetic interfering signals from other products.

Servo amplifiers of the MR-J4 series are available with an output power range from 100 W up to 22 kW. Depending on the model they are suitable for one-phase power supply (output power of 700 W or less) and three-phase power supply of 200–230 V AC or for three-phase power supply of 380–480 V AC.

The MR-J4W2-B servo is designed to drive two servo motors, the MR-J4W3-B to drive three servo motors. Both servo amplifier models are SSCNET III/H compatible enabling energy-conservative operation, less-wiring, compact machine design at lower cost.

1.2 Environmental conditions

Store and use the servo amplifier and servo motor in the following environmental conditions.

Environment		Conditions	
		Servo amplifier	Servo motor
Ambient temperature	Operation	0 to +55 C (non-freezing)	0 to +40 C (non-freezing)
	Storage	–20 to +65 C (non-freezing)	–15 to +70 C (non-freezing)
Ambient humidity	Operation	max. 90% (non-condensing)	max. 80% (non-condensing)
	Storage		max. 90% (With no dew condensation)
Atmosphere		Indoors (no direct sunlight), free from corrosive gas, flammable gas, oil mist, dust, and dirt	
Altitude		max. 1000 m	
Protective structure	IP20 ^①	HG-MR	IP65 ^②

Tab. 1-1: Environmental conditions

- ① For some models the terminal block is excluded.
- ② The shaft-through portion is excluded.
- ③ The shaft-through portion is excluded. For geared servo motor, IP rating of the reducer portion is equivalent to IP44.
- ④ Connectors and gap between rotor and stator are excluded.
- ⑤ TM-RFM040J10, TM-RFM120J10, TM-RFM240J10: X, Y: 24.5 m/s²

1.3 Terminology

The terms and abbreviations below are important for servo amplifiers and are used frequently in this guide.

Direction of rotation of electric motors

The direction (or sense) of rotation of electric motors is defined looking at the end of the motor shaft. If the motor has two shaft ends the direction is defined looking at the main drive shaft end, which is defined as the shaft end away from the end where the cooling fan or the brake are installed.

- Forward
Counterclockwise (CCW)/ Left
- Reverse
Clockwise (CW)/ Right

Safety Function

The servo amplifier series MR-J4 supports the Safe Torque Off (STO) function described in IEC/EN 61800-5-2. STO is a stop function used to shut down energy to motors which exert torque. The servo amplifier electronically cuts off the power output from the servo amplifier to the servo motor.

The purpose for this safety function is as follows.

- Uncontrolled stop according to stop category 0 of IEC 60204-1
- Designed to prevent unexpected start-up

Operating modes of the servo amplifier

The MR-J4-A servo amplifier can be set to different operating modes by parameter setting.

- Position control mode
An up to 4 Mpps high-speed pulse train is used to control the speed and direction of a motor and execute precision positioning of 4,194,304 pulses/rev (22 bits) resolution.
A torque limit is imposed on the servo amplifier by the clamp circuit to protect the power transistor in the main circuit from overcurrent due to sudden acceleration/deceleration or overload. This torque limit value can be changed to any value with an external analog input or the parameter.
- Speed control mode
An external analog speed command (0–±10 V DC) or parameter-driven internal speed command (max. 7 speeds) is used to control the speed and direction of a servo motor smoothly. There are also the acceleration/deceleration time constant setting in response to speed command, the servo lock function at a stop time, and automatic offset adjustment function in response to external analog speed command.
- Torque control mode
An external analog torque command (0–±8 V DC) or parameter-driven internal torque command is used to control the torque output by the servo motor.
To protect misoperation under no load, the speed limit function (external or internal setting) is also available for application to tension control, etc.
- Positioning mode (only RJ type)
Automatic and manual positioning modes are supported by point table, program and indexer for normal operation as well as for home position return. Home position return can be done by different methods like dog type, count type, data set type, stopper type etc.

Fully closed loop system

The MR-J4-B(-RJ)/A(-RJ) servo amplifier is compatible with fully closed loop control system. A load side encoder can be used for reading a position feedback signal in order to realise full closed position feedback. By parameter setting different control modes can be selected.

Control mode	Description
Semi closed loop control	Position is controlled according to the servo motor-side data.
Dual feedback control	Position is controlled according to the servo motor-side data and load-side data.
Fully closed loop control	Position is controlled according to the load-side data.

Tab. 1-2: *Control modes of the closed loop system*

2 Introduction of the devices

2.1 Servo amplifier series MR-J4-A(-RJ)

Fig. 2-1: Model overview of the servo amplifiers MR-J4-A(-RJ)

NOTE

The MR-J4-□A(4)-RJ servo amplifier has the CN2L connector.

2.2 Servo amplifier series MR-J4-B(-RJ)

Fig. 2-2: Model overview of the servo amplifiers MR-J4-B(-RJ)

NOTES

The number "4" in the model designation of the servo amplifier indicates the version for 400 V. If the number 4 is inside brackets, the model is also available in the version 200 V.

The MR-J4-□B(4)-RJ servo amplifier has the CN2L connector.

2.3 Servo amplifier series MR-J4W-B

Fig. 2-3: Model overview of the servo amplifiers MR-J4W-B

2.4 Model designation and output power

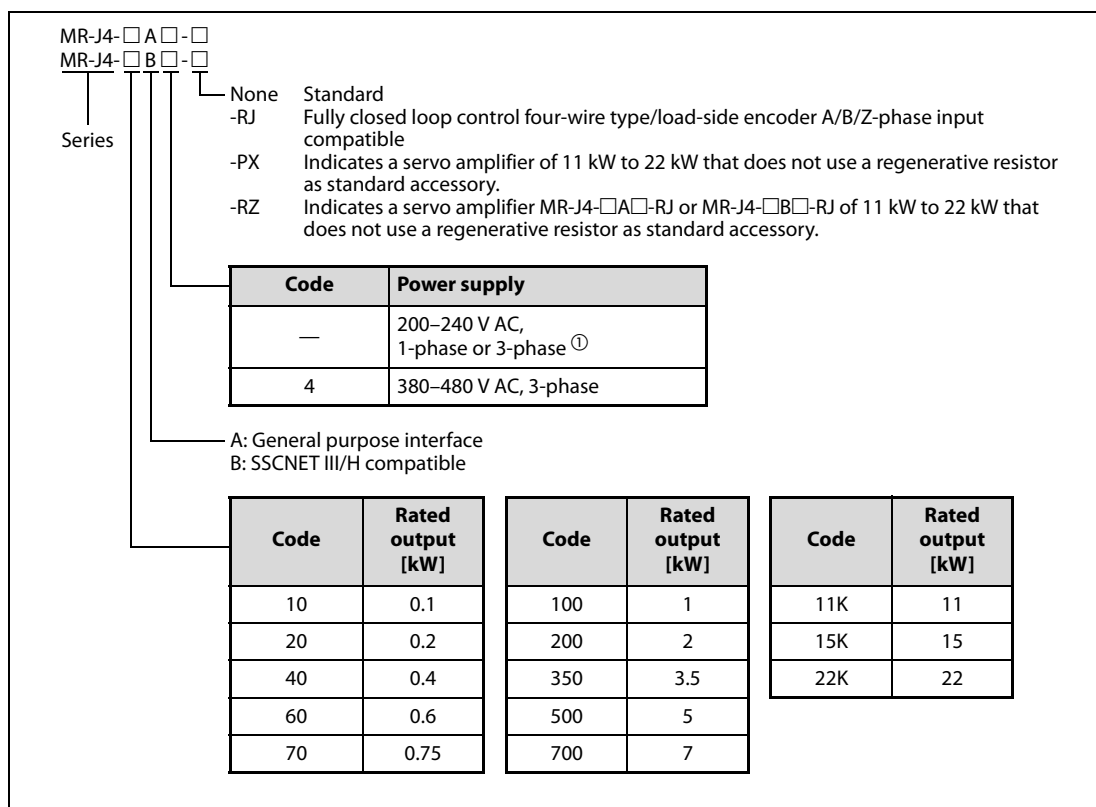

Fig. 2-4: Model designation and rated output of the servo amplifiers for one axis

① Servo amplifiers up to MR-J4-70A or MR-J4-70B (included), can be connected 1-phase.

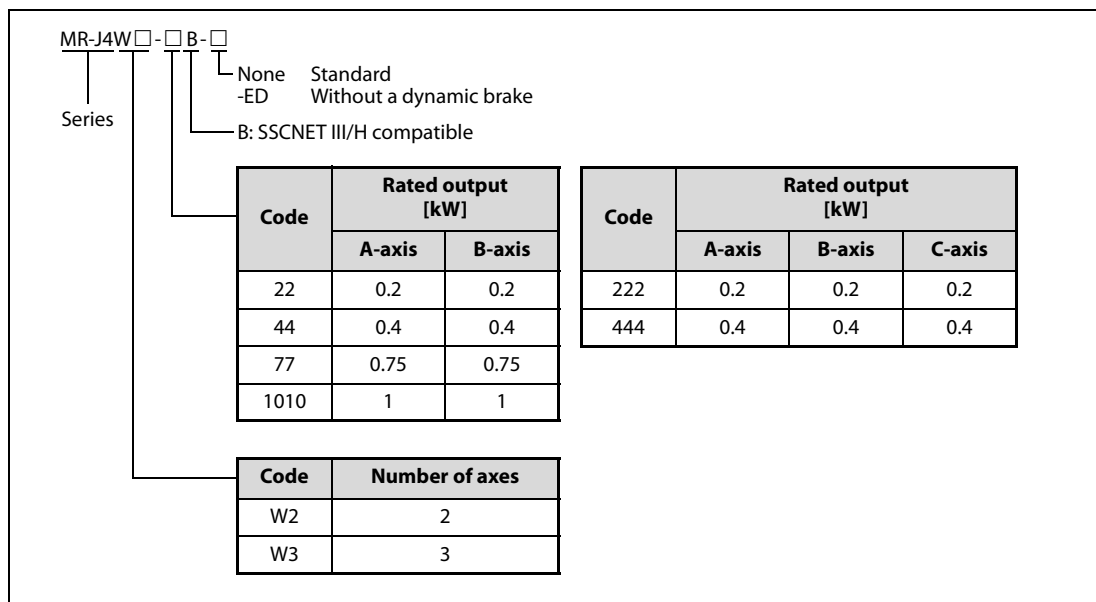

Fig. 2-5: Model designation and rated output of the servo amplifiers for two or three axes

2.5 Combinations of servo amplifiers and servo motors

The following tables show the possible combinations between the servo amplifier series MR-J4-A(-RJ), MR-J4-B(-RJ) and MR-J4W-B and the rotary motor, linear motors and direct drive motors.

2.5.1 200 V class

Servo amplifier	Rotary motor	Linear motor (primary side)	Direct drive motor
MR-J4-10A(-RJ) MR-J4-10B(-RJ)	HG-KR053, HG-KR13, HG-MR053, HG-MR13	—	—

2.6 Removal and reinstallation of the front cover

The following shows how to remove and reinstall the front cover of MR-J4-700A(-RJ)/B(-RJ) to MR-J4-22KA(-RJ)/B(-RJ) and MR-J4-500A(-RJ)/B4(-RJ) to MR-J4-22KA(-RJ)/B4(-RJ) .

**DANGER:**

Before removing or reinstalling the front cover, make sure that the charge lamp is off more than 15 minutes after power off. Then, confirm that the voltage between P+ and N- is safe with a voltage tester and others. Otherwise, you may get an electric shock. In addition, when confirming whether the charge lamp is off or not, always confirm it from the front of the servo amplifier.

NOTE

The MR-J4-A series will be used hereinafter as an example for the removal and attachment of the front cover. The procedure for the MR-J4-B series is identical.

The figures below show the steps for removing (fig. 2-6 to fig. 2-8) and reinstalling (fig. 2-9 to fig. 2-11) of the front cover for the servo amplifier MR-J4-700A.

2.6.1 Removal of the front cover

- ① Hold the ends of lower side of the front cover with both hands.

**Fig. 2-6:**

Step ①: Removing the front cover

MR-J4-700A_Frontabdeckung entfernen_1.eps

- ② Pull up the cover, supporting at point ①.

Fig. 2-7:

Step ②: Removing the front cover

MR-J4-700A_Frontabdeckung entfernen_2.eps

- ③ Pull out the front cover to remove. Hold the ends of lower side of the front cover with both hands.

Fig. 2-8:

Step ③: Removing the front cover

MR-J4-700A_Frontabdeckung entfernen_3.eps

2.6.2 Reinstallation of the front cover

- ① Insert the front cover setting tabs into the sockets of the servo amplifier (2 places).

Fig. 2-9:

Step ①: Reinstalling the front cover

MR-J4-700A_Frontabdeckung anbringen_1.eps

- ② Push down the cover, supporting at point ①.

Fig. 2-10:

Step ②: Reinstalling the front cover

MR-J4-700A_Frontabdeckung anbringen_2.eps

- ③ Press the cover against the terminal box until the setting tabs click.

Fig. 2-11:

Step ③: Reinstalling the front cover

MR-J4-700A_Frontabdeckung anbringen_3.eps

NOTE

The multi-axis servo amplifier MR-J4W-B has no front cover.

2.7 Rating plate

The following shows two examples of the rating plate for explanation of each item.

NOTE

Production year and month of the servo motor are indicated in a serial number on the rating plate. The year and month are indicated by the last two digits of the year and one digit of the month [1 to 9, X(10), Y(11), and Z(12)].
For January 2012, the Serial No. is like, "SER. _____ 121"

2.7.1 MR-J4-A(-RJ) and MR-J4-B(-RJ)

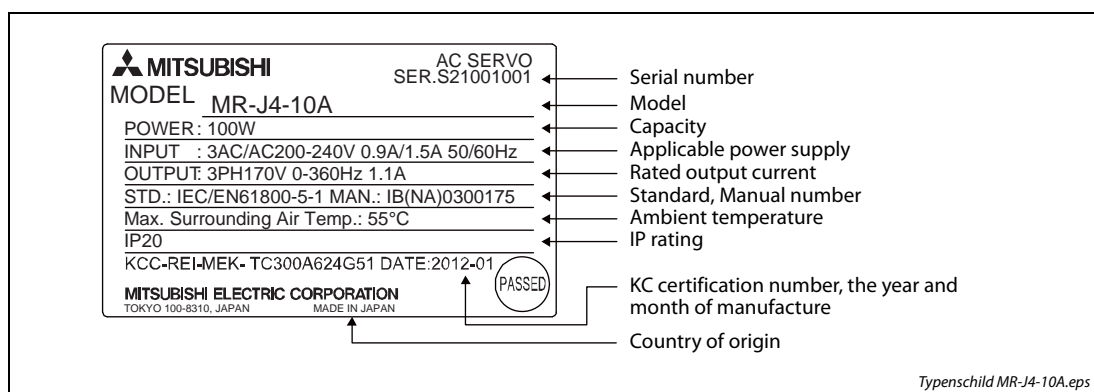

Fig. 2-12: Rating plate MR-J4-10A

2.7.2 MR-J4W-B

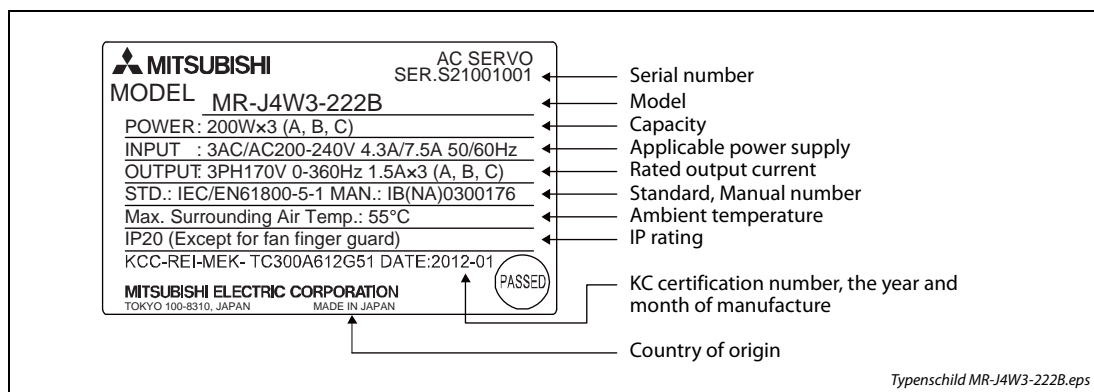

Fig. 2-13: Rating plate MR-J4W3-222B

3 Introduction of the servo motors

This chapter shows the various servo motors that are available for the servo amplifier series MR-J4-A, MR-J4-B and MR-J4W-B.

The motors are classified into rotatory motors, linear motors and direct drive motors.

Refer to section 2.5. to get the recommended combinations of servo amplifiers and servo motors.

3.1 Rotatory servo motors

3.1.1 Model overview

Fig. 3-1: Rotatory servo motors

3.1.2 Rating plate

The rating plate of the servo motor HG-JR153 is shown below.
This rating plate is representative of all other servo motor models.

Fig. 3-2: Rating plate HG-JR153

- ① Production year and month of the servo motor are indicated in a serial number on the rating plate.
The year and month are indicated by the last two digits of the year and one digit of the month [1 to 9, X(10), Y(11), and Z(12)].
For January 2012, the Serial No. is like, "SER. _____ 121".
- ② Products approved by Certification Bodies are marked. The marks depends on the Certification Bodies.

NOTE

All rotary servo motors meet the standards CE, UL and CSA.

3.1.3 Servo motor series HG-MR and HG-KR

- Model HG-MR – Ultra-low inertia/small capacity

Small motor inertia moment makes this unit well suited for high-dynamic positioning operations with extra small cycle times.

Application example

- Inserters, mounters, bonders
- Printed board hole openers
- In-circuit testers
- Label printers
- Knitting and embroidery machinery
- Ultra-small robots and robot tips

- Model HG-KR – Low inertia/small capacity

Larger motor inertia moment makes this unit well suited for machines with fluctuating load inertia moment or machines with low rigidity such as conveyors.

Application example

- Conveyors
- Food preparation machinery
- Printers
- Small loaders and unloaders
- Small robots and component assembly devices
- Small X-Y tables
- Small press feeders

Model designation

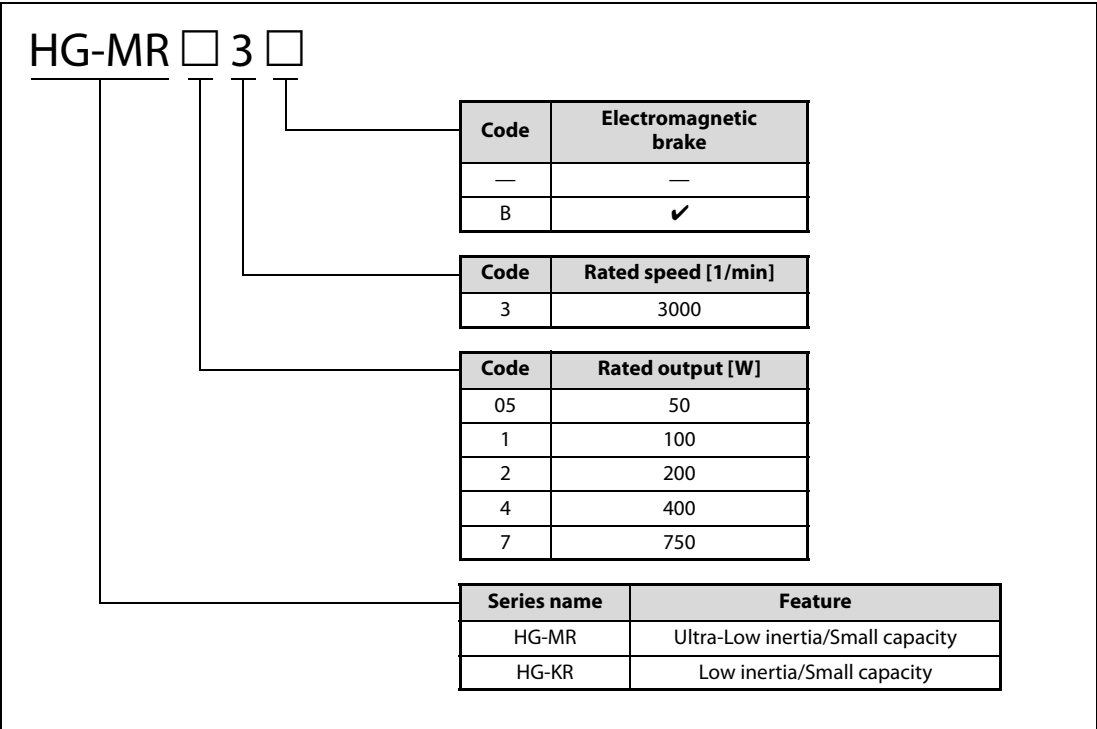

Fig. 3-3: Model designation of the servo motor series HG-MR and HG-KR

Fig. 3-4: Servo motor series HG-MR and HG-KR

NOTE

| Servo motors without electromagnetic brake have no brake connector.

3.1.4 Servo motor series HG-SR

Model HG-SR – Medium inertia/medium capacity

Stable control is performed from low to high speeds, enabling this unit to handle a wide range of applications (e.g. direct connection to ball screw components).

Application example

- Conveyor machinery
- Specialised machinery
- Robots
- Loaders and unloaders
- Winders and tension devices
- Turrets
- X-Y tables
- Test devices

Model designation

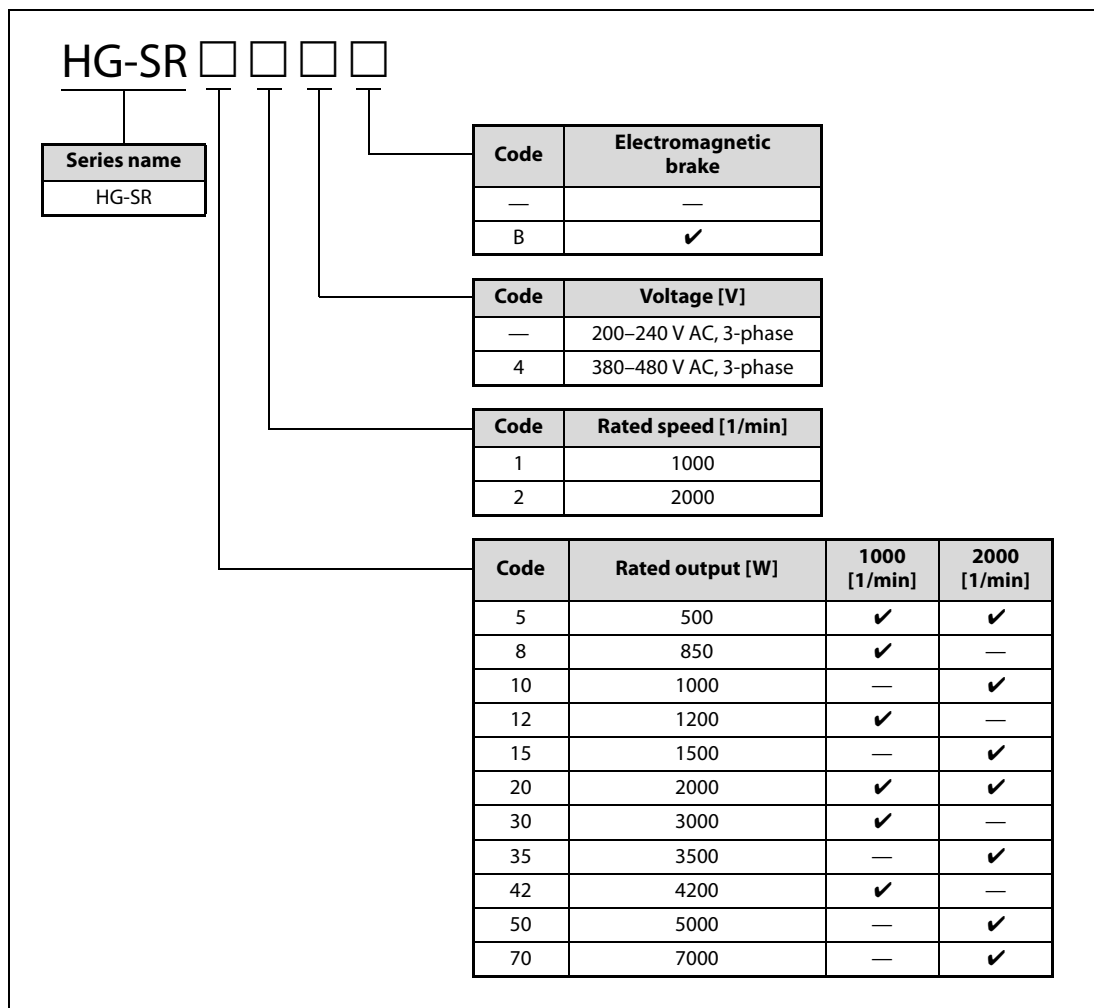

Fig. 3-5: Model designation of servo motors series HG-SR

Fig. 3-6: Servo motor series HG-SR

NOTE

Servo motors without electromagnetic brake have no brake connector.

3.1.5 Servo motor series HG-JR

Model HG-JR – Low inertia/medium capacity

This medium/large capacity, low inertia servo motor is suitable for high-throughput and high-acceleration/deceleration operations.

Application example

- Packaging machines
- Printing machines
- Palletizing machines
- Press machines
- Injection moulding machines

Model designation

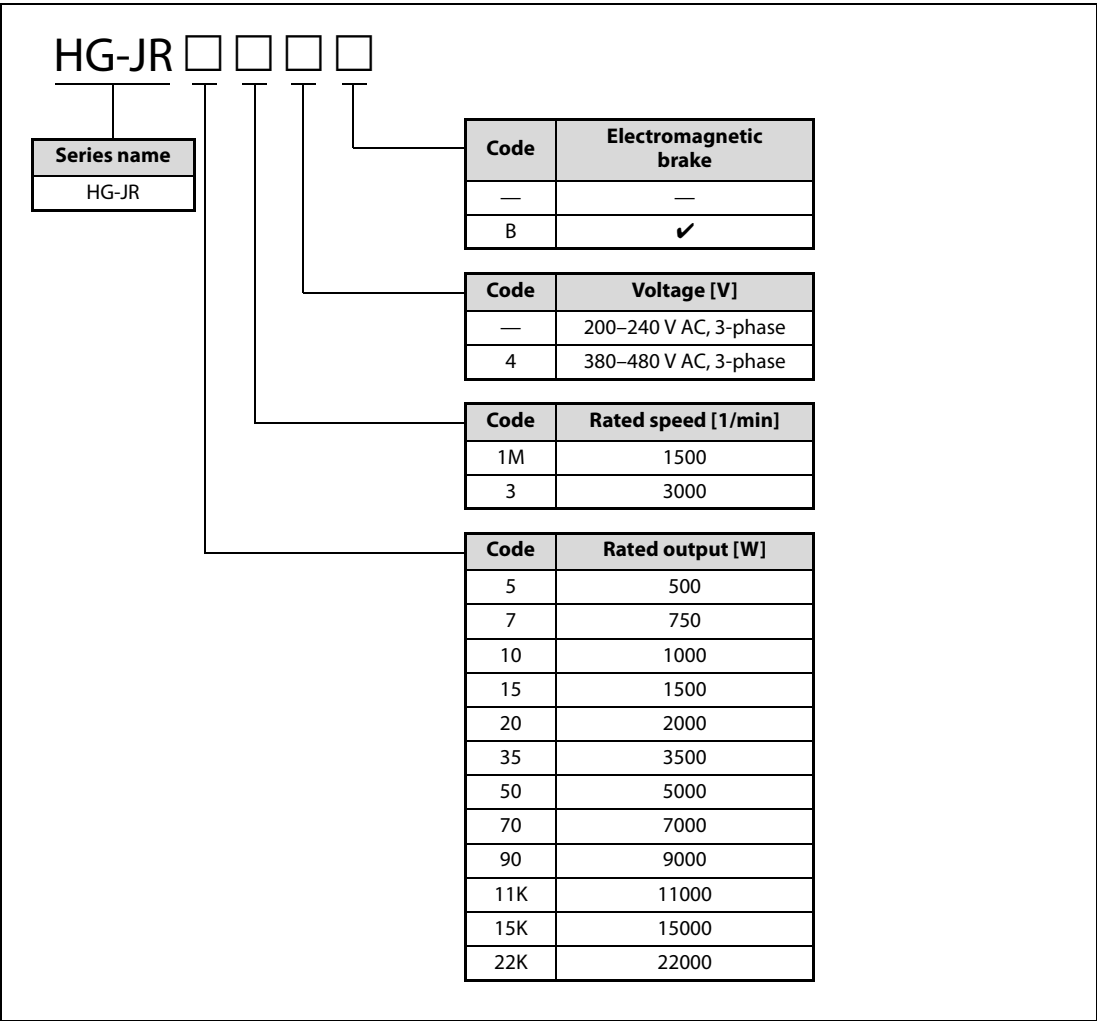

Fig. 3-7: Model designation of servo motors series HG-JR

Fig. 3-8: Servo motor series HG-JR

NOTE

Servo motors without electromagnetic brake have no brake connector.

3.1.6 Servo motor series HG-RR

Model HG-RR – Ultra-low inertia/medium capacity

This medium capacity, ultra-low inertia servo motor is perfect for high-throughput operations.

Application example

- Ultra-high-throughput machines
- Cutter
- high-frequency conveyor machines

Model designation

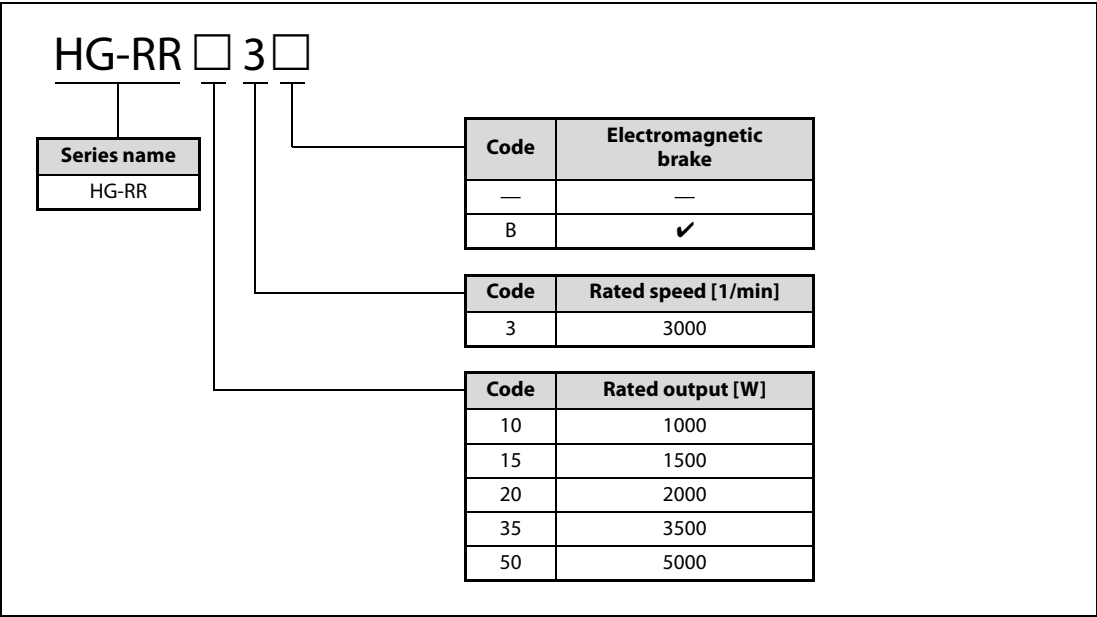

Fig. 3-9: Model designation of servo motors series HG-RR

Fig. 3-10: Servo motor series HG-RR

① The brake connector is combined with the power connector.

NOTE

Servo motors without electromagnetic brake have no brake connector.

3.1.7 Servo motor series HG-UR

Model HG-UR – Flat type/medium capacity

This medium capacity, flat type servo motor is well suited for situations where the installation space is limited.

Application example

- Robots
- Material handling
- Food processing machines

Model designation

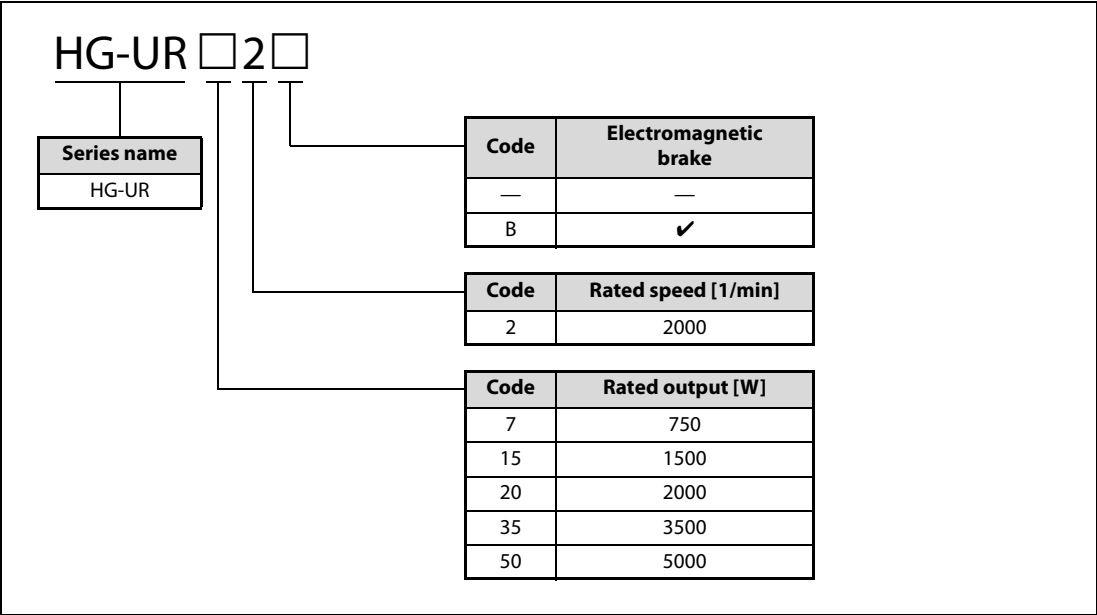

Fig. 3-11: Model designation of servo motors series HG-UR

Fig. 3-12: Servo motor series HG-UR

NOTE

Servo motors without electromagnetic brake have no brake connector.

3.2 Linear servo motors

3.2.1 Model overview

Fig. 3-13: Linear servo motors

3.2.2 Rating plate (primary side – coil)

The rating plate of the linear servo motor LM-H3P3A-12P-CSS0 is shown below. This rating plate is representative of all other linear motor models.

	 MITSUBISHI ELECTRIC			LINEAR SERVO MOTOR	
Model, insulation class	LM-H3P3A-12P-CSS0		F class		
Continuous thrust, maximum speed, frequency	120N	3.0 m/s	0-63Hz		
	INPUT 3AC 170V		(230V)	1.7A	
Serial number ①	SER. A12345001 121		MADE IN JAPAN		
Over Voltage Cat.Ⅲ (Supply Power System: TN-C, TN-S)					
MITSUBISHI ELECTRIC CORPORATION					

Typenschild LM-H3P3A-12P-CSS0.eps

Fig. 3-14: Rating plate LM-H3P3A-12P-CSS0

- ① Production year and month of the primary side of linear servo motor are indicated in a serial number on the rating plate.
The year and month are indicated by the last two digits of the year and one digit of the month [1 to 9, X(10), Y(11), and Z(12)].
For January 2012, the Serial No. is like, "SER. _____ 121".

NOTE | All linear servo motors meet the standards CE, UL and CSA.

3.2.3 Servo motor series LM-H3

The core type linear servo motor LM-H3 is suitable for space-saving, high speed and high acceleration/ deceleration.

Application example

- Mounting systems
- Material handlings
- High speed linear transportation systems

Model designation

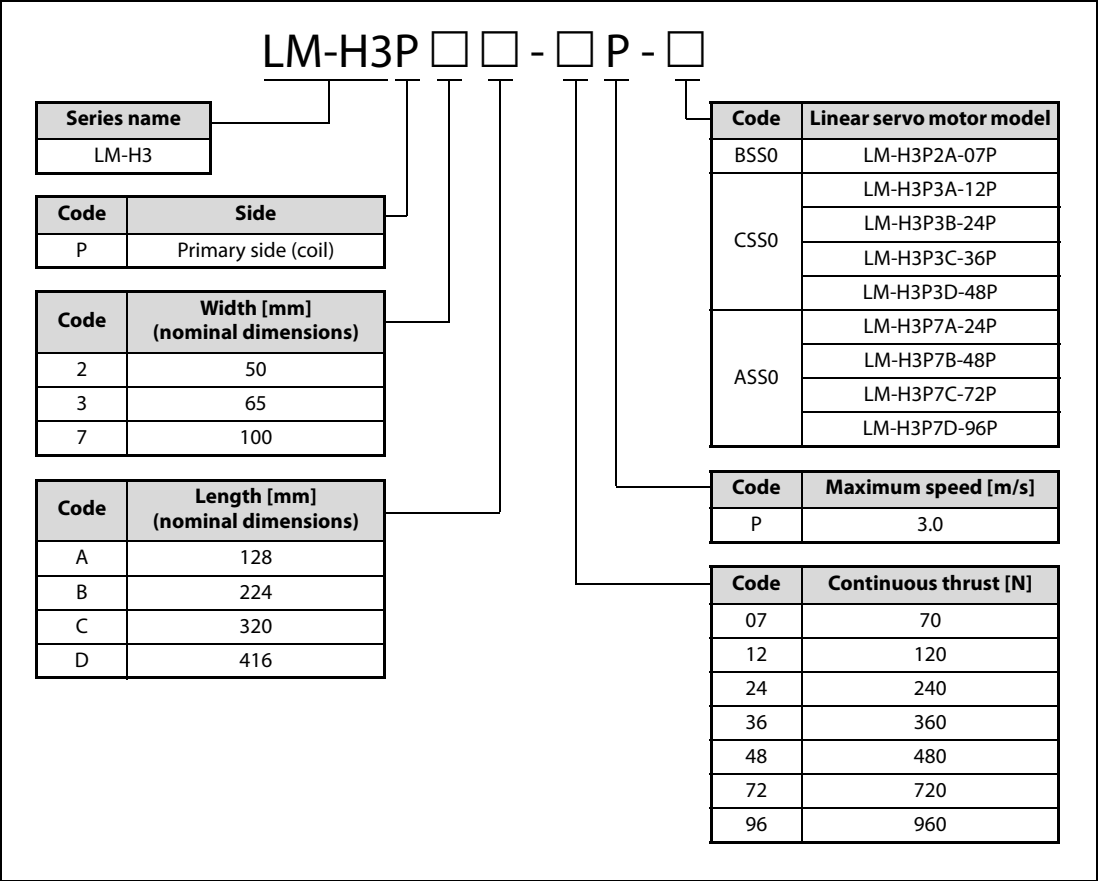

Fig. 3-15: Model designation of servo motors series LM-H3 (Primary side – coil)

Fig. 3-16: Servo motor series LM-H3 (Primary side – coil)

3.2.4 Servo motor series LM-U2

The characteristics of the linear servo motor LM-U2 are no cogging and a small speed fluctuation. Due to the missing magnetic attraction force the life time of the linear guides is longer.

Application example

- Material handlings
- Inspection systems
- Scanning exposure systems
- Screen printing systems

Model designation

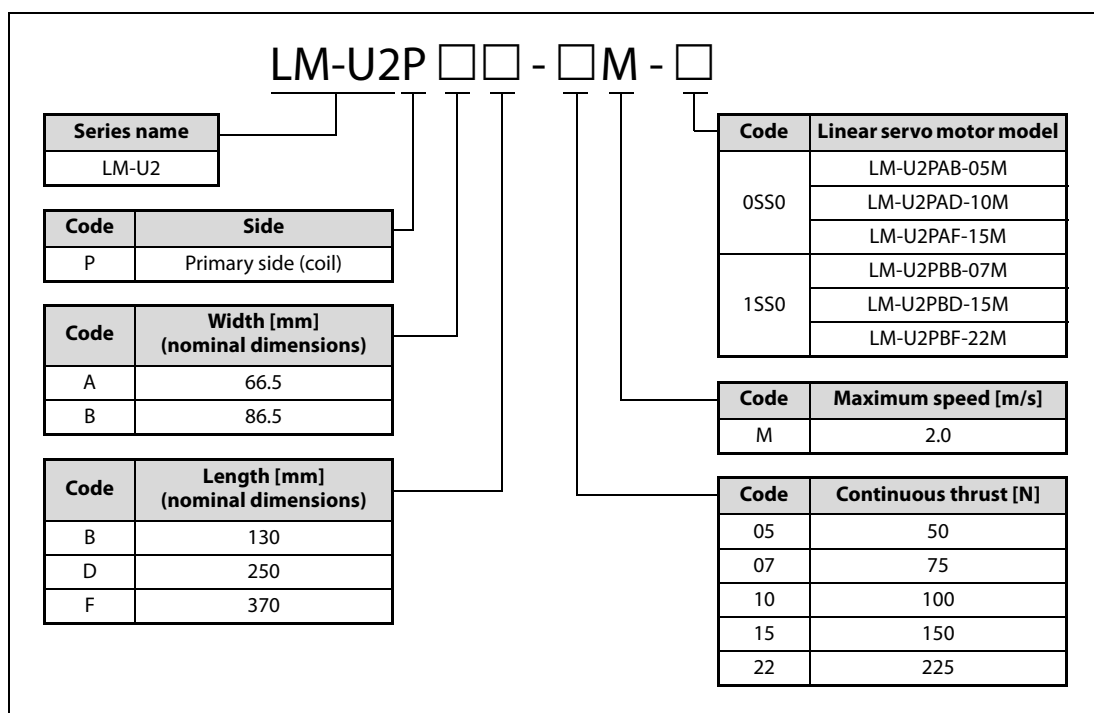

Fig. 3-17: Model designation of servo motors series LM-U2 (Primary side – coil)
Medium thrust series

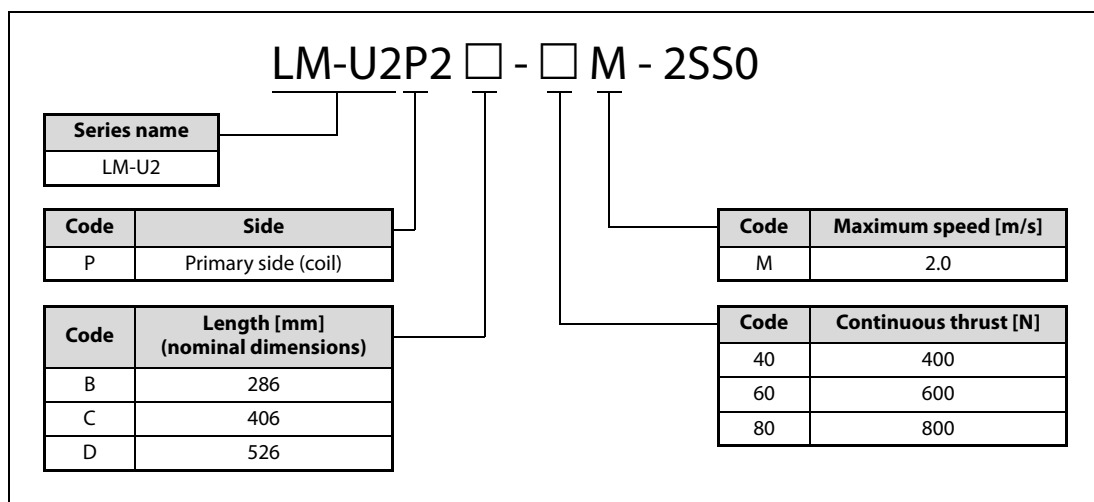

Fig. 3-18: Model designation of servo motors series LM-U2 (Primary side – coil)
Large thrust series

Fig. 3-19: Servo motor series LM-U2 (Primary side – coil)

3.2.5 Servo motor series LM-F

The linear servo motor LM-F has a compact core and the integrated liquid-cooling system doubles the continuous thrust.

Application example

- NC machine tools
- Material handlings
- Press feeders

Model designation

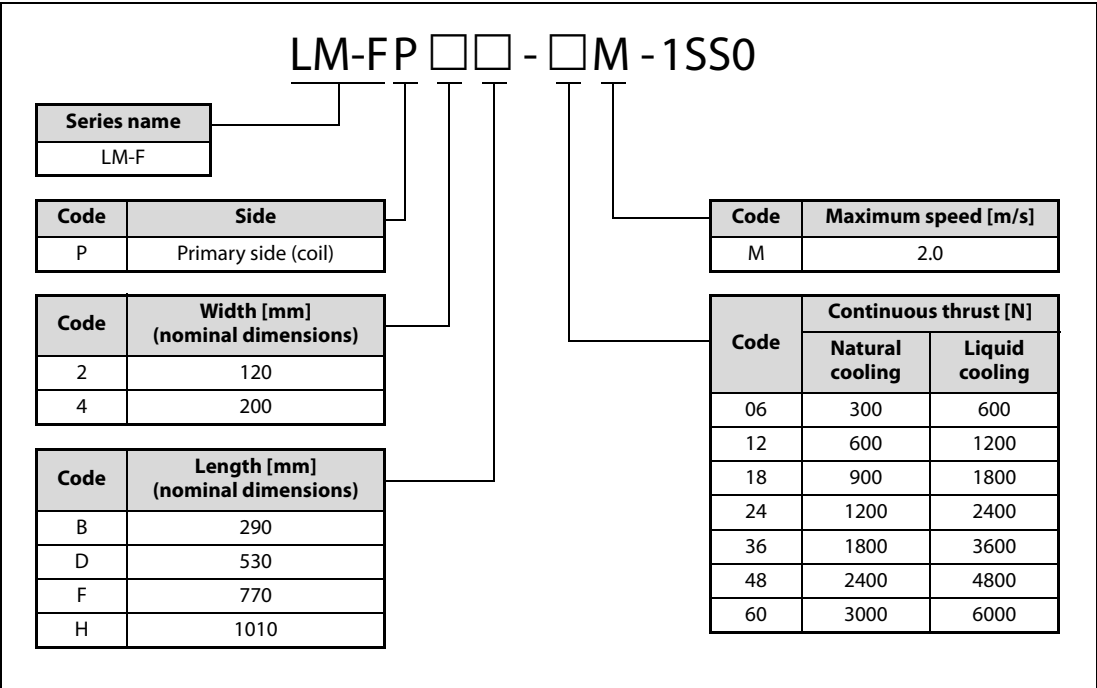

Fig. 3-20: Model designation of servo motors series LM-F (Primary side – coil)

Fig. 3-21: Servo motor series LM-F (Primary side – coil)

3.2.6 Servo motor series LM-K2

Due to the magnetic attraction counter-force structure the servo motor LM-K2 has a longer life of the linear guides. During operation the audible noise is low.

Application example

- Mounting systems
- Assembly systems

Model designation

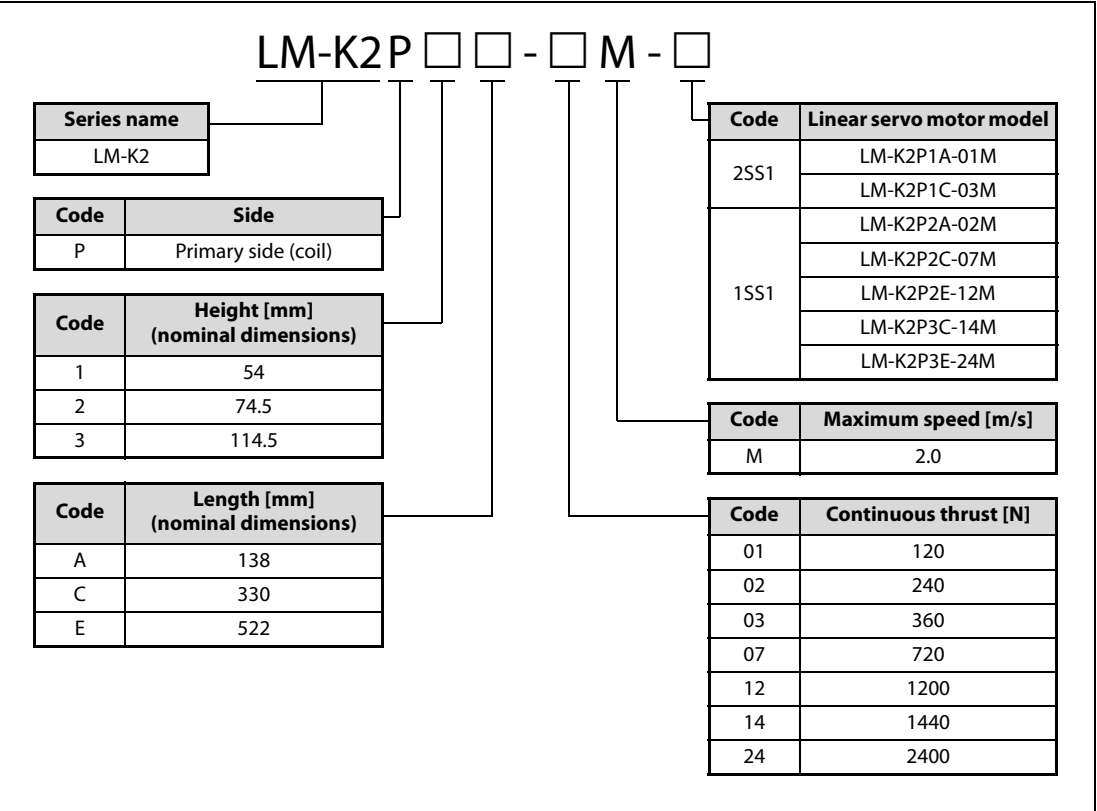

Fig. 3-22: Model designation of servo motors series LM-K2 (Primary side – coil)

Fig. 3-23: Servo motor series LM-K2 (Primary side – coil)

3.3 Direct drive servo motors

3.3.1 Model overview

Fig. 3-24: Direct drive servo motor

3.3.2 Rating plate (primary side – coil)

The rating plate of the direct drive servo motor TM-RFM002C20 is shown below. This rating plate is representative of all other direct drive motor models.

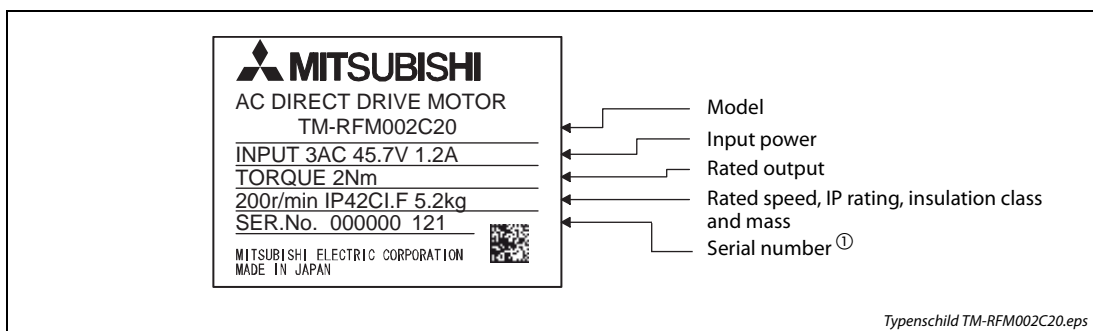

Fig. 3-25: Rating plate TM-RFM002C20

- ① Production year and month of the direct drive motor are indicated in a serial number on the rating plate.

The year and month are indicated by the last two digits of the year and one digit of the month [1 to 9, X(10), Y(11), and Z(12)].

For January 2012, the Serial No. is like, "SER. _____ 121".

NOTE

All direct drive servo motors meet the standard CE.

3.3.3 Servo motor series TF-RFM

The magnetic design and winding technology of the servo motor TF-RFM enables high torque density. In addition, extremely smooth rotation is achieved by minimizing the torque ripple. The motor is suitable for low-speed and high-torque operations. High-accuracy positioning is achieved because the motor is directly connected to the driving part. The servo motor is equipped with a 20-bit high-resolution absolute position encoder (1 048 576 pulses/rev) as standard.

Application example

- Index table for machine tools
- Rotary axis for material handling robots
- Painting and vapour deposition systems
- LCD/semiconductor spin-type cleaning systems
- LCD/semiconductor testing systems (XY-tables)
- Rotary axis for polishing systems

Model designation

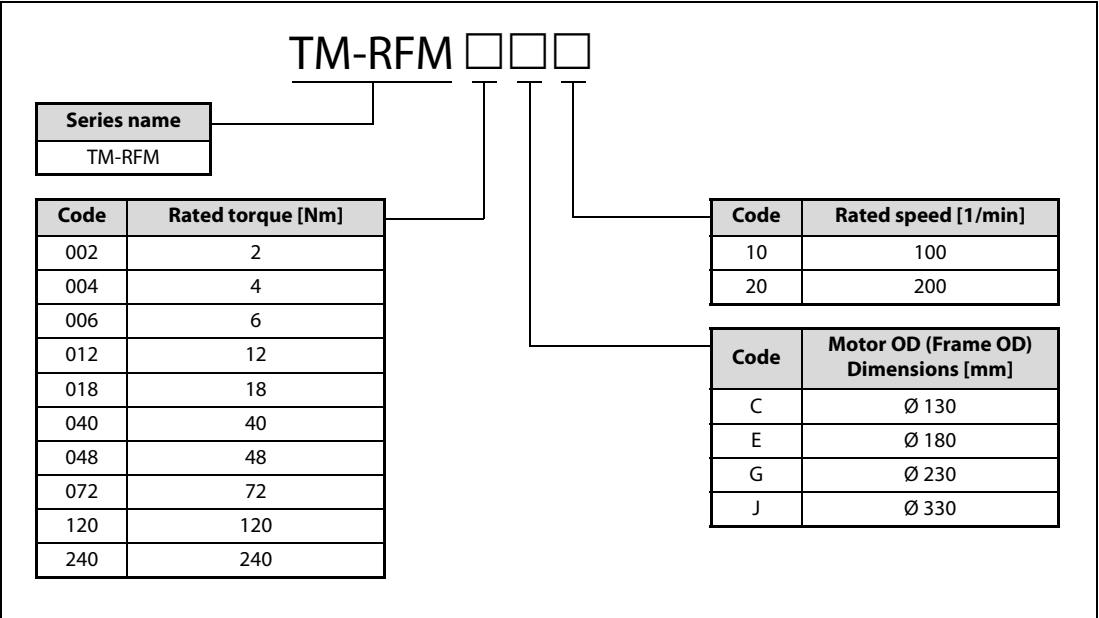

Fig. 3-26: Model designation of servo motors series TM-RFM

Fig. 3-27: Servo motor series TM-RFM

4 Installation and wiring

DANGER:

Before starting wiring, switch power off, then wait for more than 15 minutes, and after the charge lamp has gone off, make sure that the voltage is safe with a tester or like. Otherwise, you may get an electric shock.

4.1 Wiring of power supply, motor and PE terminal

The power supply of some models of the servo amplifier series MR-J4 can either be 1-phase or 3-phase AC voltage (200 V class), while others can only be powered by 3-phase power supply (200 V/400 V class).

Power supply of MR-J4-10A(-RJ)/B(-RJ) to MR-J4-70A(-RJ)/B(-RJ)

Item	1-phase	3-phase
Main circuit power supply	L1, L3	L1, L2, L3
Control circuit power supply	L11, L21 ①	
Voltage	200–240 V AC	
Permissible voltage fluctuation	170–264 V AC	
Frequency	50 Hz/60 Hz ±5%	

Power supply of MR-J4-100A(-RJ)/B(-RJ) to MR-J4-22KA(-RJ)/B(-RJ)

Item	3-phase ②
Main circuit power supply	L1, L2, L3
Control circuit power supply	L11, L21 ①
Voltage	200–240 V AC
Permissible voltage fluctuation	170–264 V AC
Frequency	50 Hz/60 Hz ±5%

Power supply of MR-J4-60A4(-RJ)/B4(-RJ), MR-J4-100A4(-RJ)/B4(-RJ) to MR-J4-22KA4(-RJ)/B4(-RJ)

Item	3-phase ②
Main circuit power supply	L1, L2, L3
Control circuit power supply	L11, L21 ①
Voltage	380–480 V AC
Permissible voltage fluctuation	323–528 V AC
Frequency	50 Hz/60 Hz ±5%

① The power supply of the control circuit is connected to L11 and L21. For 3-phase connection of the main circuit power supply L11 should be in phase with L1 and L21 in phase with L2, for 1-phase connection L11 should be in phase with L1 and L21 in phase with L3.

② It is not possible, to connect these models only to one phase.

Power supply of MR-J4W2-22B to MR-J4W2-77B, MR-J4W3-222B and MR-J4W3-444B

Item	1-phase	3-phase
Main circuit power supply	L1, L3	L1, L2, L3
Control circuit power supply	L11, L21 ①	
Voltage	200–240 V AC	
Permissible voltage fluctuation	170–264 V AC	
Frequency	50 Hz/60 Hz $\pm 5\%$	

Power supply of MR-J4W2-1010B

Item	3-phase ②
Main circuit power supply	L1, L2, L3
Control circuit power supply	L11, L21 ①
Voltage	200–240 V AC
Permissible voltage fluctuation	170–264 V AC
Frequency	50 Hz/60 Hz $\pm 5\%$

① The power supply of the control circuit is connected to L11 and L21. For 3-phase connection of the main circuit power supply L11 should be in phase with L1 and L21 in phase with L2, for 1-phase connection L11 should be in phase with L1 and L21 in phase with L3.

② It is not possible, to connect these models only to one phase.

The power supply with 1-phase is connected to the terminals L1 and L3, with 3-phase to terminals L1, L2 and L3.

The motor is connected to terminals U, V and W.

Additionally the servo amplifier must be grounded via the PE terminal (Protective Earth).

NOTE

Even if the servo amplifiers is supplied with an 1-phase AC voltage of 200 to 240 V the servo motor is connected in the same way to the output of the servo amplifier as with a 3-phase power supply. The power supply from the servo amplifier to the servo motor is always 3 phase.

**WARNING:**

- **Do not connect AC power supply directly to the output terminals U, V and W of the servo amplifier. Permanent damage of the servo amplifier as well as an immediate danger to the operator would be the consequence.**
- **Connect the 1-phase 200 V AC to 240 V AC power supply to L1 and L3. One of the connecting destinations is different from MR-J3 Series Servo Amplifier's. When using MR-J4 as a replacement for MR-J3, be careful not to connect the power to L2.**

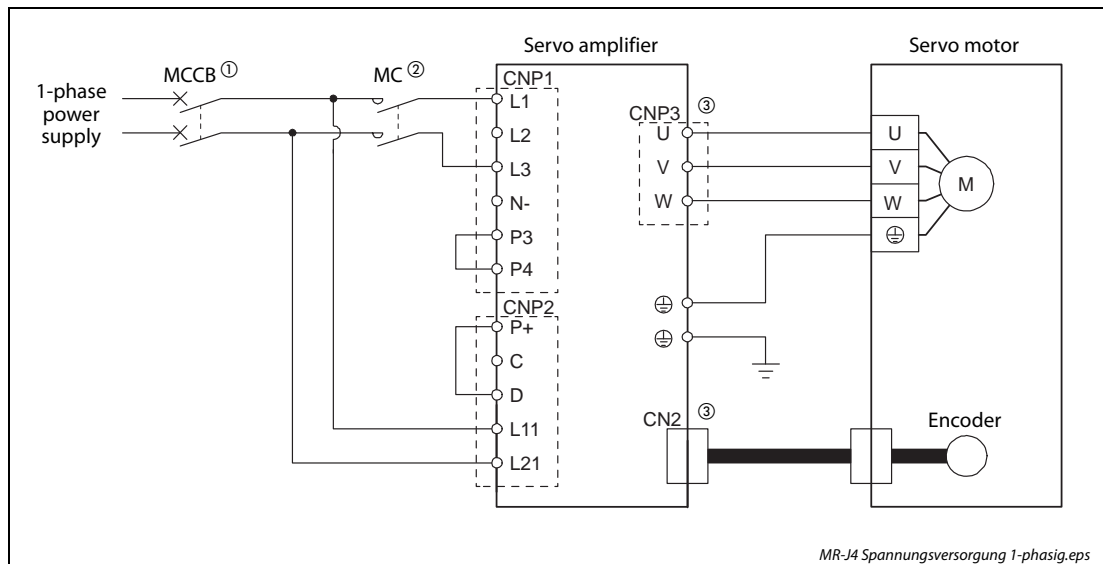

Fig. 4-1: Wiring of the power inputs and outputs of the servo amplifier (1-phase power supply)

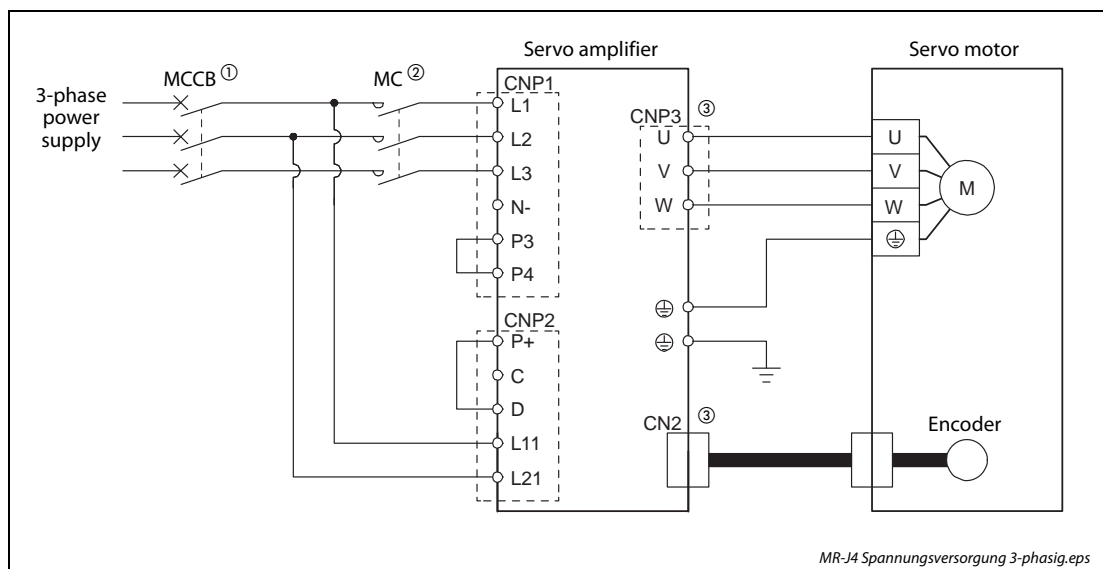

Fig. 4-2: Wiring of the power inputs and outputs of the servo amplifier (3-phase power supply)

- ① MCCB = Molded-case circuit breaker
- ② MC = Magnetic contactor
- ③ The MR-J4 2-axis servo amplifier (MR-J4W2-B) has two motor outputs (CNP3A, CNP3B) and two encoder inputs (CN2A, CN2B). The MR-J4 3-axis servo amplifier (MR-J4W3-B) has three motor outputs (CNP3A, CNP3B, CNP3C) and three encoder inputs (CN2A, CN2B, CN2C).

Abbreviation	Terminals	Description
L1, L3	Main circuit power supply (1-phase)	Power supply of the servo amplifier (main circuit)
L1, L2, L3	Main circuit power supply (3-phase)	
U, V, W	Servo motor power output	Voltage output of the servo amplifier
L11, L21	Control circuit power supply	Power supply of the control circuit
P+, C, D	Regenerative option	Terminals P+ and –D are wired by default. When using regenerative option, disconnect the P+ and D terminals and connect the regenerative option to P+ terminal and C terminal.
P3, P4	Power factor improving DC reactor	When not using the power factor improving DC reactor, connect P3 and P4. (factory-wired). When using the power factor improving DC reactor, disconnect P3 and P4, and connect the power factor improving DC reactor to P3 and P4.
N–	Power regeneration converter Power regeneration common converter Brake unit	This terminal is used for a power regeneration converter, power regeneration common converter and brake unit.
	Protective earth (PE)	Connect it to the grounding terminal of the servo motor and to the protective earth (PE) of the cabinet for grounding.

Tab. 4-1: Power terminals of the servo amplifier**NOTE**

Please refer to the respective instruction manual of the servo amplifier series MR-J4-A, MR-J4-B MR-J4W2-B and MR-J4W3-B for details about different terminal designations of specific servo amplifier models.

4.2 Connectors and signal arrangements

Apart from the terminals of the power unit for supply voltage and motor, a servo amplifier is equipped with even more terminals for controlling the servo amplifier. These additional terminals are used for the safety function (STO), to connect an optional PC, to connect an optional battery and for monitoring, diagnosis and so on.

4.2.1 Servo amplifier series MR-J4-A

The shown front view is that of the servo amplifier MR-J4-20A-RJ or less. For all models of the MR-J4-A series the terminal configuration is the same.

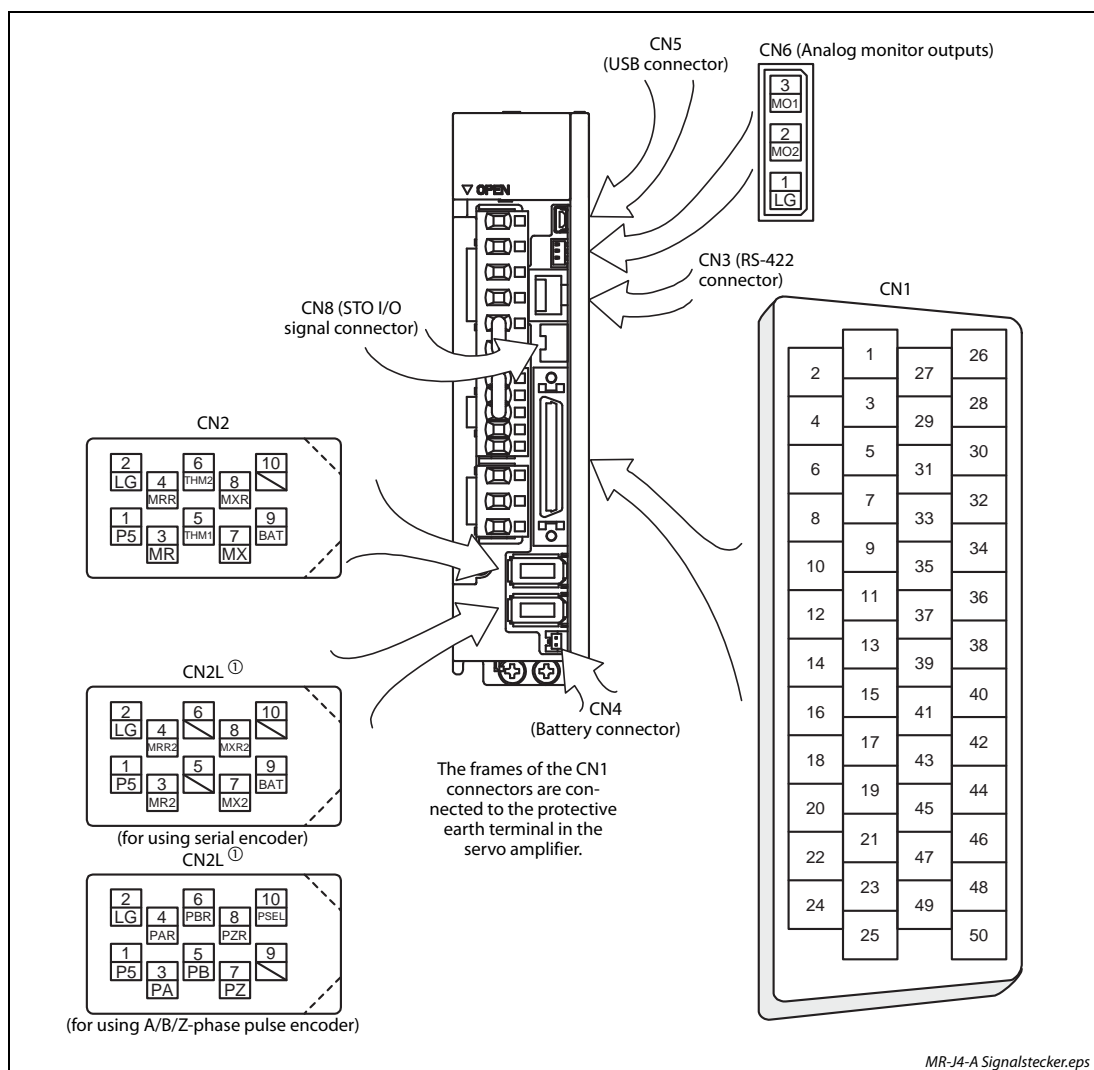

Fig. 4-3: MR-J4-A signal arrangement

① The MR-J4-□A(4)-RJ servo amplifiers have CN2L connectors.

Signal assignment

Connector	Name	Description
CN1	I/O devices	Control interface (see tab. 4-3)
CN2	Encoder connector	Connector for the servo motor encoder
CN2L ①		Connector for external encoder (Serial encoder or A/B/Z-phase pulse encoder)
CN3	Communication (RS-422)	Connector for a personal computer (PC)
CN4	Battery terminal	For connecting the battery (MR-BAT6V1SET) to store the data of the absolute position detection (observe the following note). When you want to connect the battery, disconnect the power supply of the main circuit and wait for more than 15 minutes, after the charge lamp has gone off. When replacing the battery, leave the power supply of the control circuit on and disconnect only the supply voltage of the main circuit. Otherwise, the absolute position data will be lost.
CN5	Communication (USB)	Connector for a personal computer (PC)
CN6	Analog monitor outputs	This is used to output data selected by parameters as an analog voltage for measuring instruments or the like.
CN8	STO connector	Connector for safety function (Safe Torque Off)

Tab. 4-2: Description of CN1, CN2, CN2L, CN3, CN4, CN5, CN6 and CN8

① The MR-J4-□A(4)-RJ servo amplifiers have CN2L connectors.

NOTE

The MR-BAT6V1BJ battery for junction battery cable is only for the HG series servo motors. It cannot be used with direct drive motors. Do not use the MR-BAT6V1BJ battery for junction battery cable in the fully closed loop system.

The device assignment of the CN1 connector pins changes depending on the control mode. For the pins which are given parameters in the related parameter column, their devices will be changed using those parameters.

③ TLA will be available when TL (External torque limit selection) is enabled with parameters PD04, PD06, PD08, PD10, PD12, PD14, PD18, PD20, PD22, PD44, and PD46.

④ Assign any device with Parameter PD47.

⑤ Assign MD1 with Parameter PD10.

⑥ Assign the following output devices to CN1-22, CN1-23, and CN1-25 pins with parameters PD23, PD24, and PD26.

CN1-22: CPO (Rough match)

CN1-23: ZP (Home position return completion)

CN1-25: MEND (Travel completion)

Meaning of the symbols

The most important signals are explained in the table below. You will find detailed information about all signals in the instruction manual of the respective servo amplifier.

Signal	Symbol	Name	Description
Control terminals	Signal inputs	RES	Reset
		LSP	Forward rotation stroke end
		LSN	Reverse rotation stroke end
		SON	Servo-on
		ST1	Forward rotation start
		ST2	Reverse rotation start
		EM2	Forced stop 2
		MD0 ②	Operation mode selection 1
		MD1 ②	Operation mode selection 2
		DOG ②	Proximity dog
	Signal outputs	ALM	Alarm
		RD	Ready
		INP	In position
		WNG	Warning
		ACD0 ACD1 ACD2	Alarm code
		MEND ②	Travel completion

Tab. 4-5: Selection of the most important input and output signals of CN1 (1)

Signal	Symbol	Name	Description
Analog terminals	Command inputs	TC ①	Analog torque command Used to control torque in the full servo motor output torque range. Apply 0 to ± 8 V DC across TC–LG. Maximum torque is generated at ± 8 V. The speed at ± 8 V can be changed with Parameter PC13.
		VC	Analog speed command ② Apply 0 to ± 10 V DC across VC–LG. Speed set in parameter PC12 is provided at ± 10 V.
			Analog override ① The signal controls the servo motor setting speed by applying -10 V to $+10$ V to between VC and LG. The percentage will be 0% with -10 V, 100% with 0 V, and 200% with $+10$ V to the setting speed of the servo motor. Resolution: 14 bits or equivalent
		VLA	Analog speed limit Setting of speed limit in torque control mode by applying 0 to $+10$ V. The maximum speed set in parameter PC12 is output at $+10$ V.
	Analog output	MO1	Analog monitor 1 Used to output the data set in parameter PC14 to across MO1–LG in terms of voltage.
		MO2	Analog monitor 2 Used to output the data set in parameter No. PC15 to across MO2–LG in terms of voltage.
Power supply	Common	DICOM	Input 24 V DC ($\pm 10\%$, 500 mA) to I/O interface For sink interface, connect + of 24 V DC external power supply. For source interface, connect – of 24 V DC external power supply.
		DOCOM	Common terminal of input signal such as EM2 of the servo amplifier. This is separated from LG. For sink interface, connect – of 24 V DC external power supply. For source interface, connect + of 24 V DC external power supply.
		LG	This is a common terminal for TLA, TC, VC, VLA, FPA, FPB, OP, MO1, MO2, and P15R
	P15R		This outputs 15 V DC to between P15R and LG. This is available as power for TC, TLA, VC, or VLA. Permissible current: 30 mA
	SD		Shielding, housing

① Only for MR-J4-□A

② Only for MR-J4-□A-RJ

4.2.2 Servo amplifier series MR-J4-B

The shown front view is that of servo amplifier MR-J4-20B-RJ or less. The terminal configuration is the same for all models of the MR-J4-B series.

Fig. 4-4: MR-J4-B signal arrangement

① The MR-J4-□B(4)-RJ servo amplifiers have CN2L connectors.

Signal assignment

Connector	Name	Description
CN1A	Connector for SSCNET III cable for previous servo amplifier axis	Used for connection with the controller or the servo amplifier of the previous axis.
CN1B	Connector for SSCNET III cable for next servo amplifier axis	Used for connection with the servo amplifier of the next axis. Put a cap on the CN1B connector of the final axis.
CN2	Encoder connector	Connector for the servo motor encoder
CN2L ①		Connector for external encoder (Serial encoder or A/B/Z-phase pulse encoder)
CN3	I/O devices	Control interface (see tab. 4-7)
CN4	Battery terminal	For connecting the battery (MR-BAT6V1SET) to store the data of the absolute position detection (observe the following note). When you want to connect the battery, disconnect the power supply of the main circuit and wait for more than 15 minutes, after the charge lamp has gone off. When replacing the battery, leave the power supply of the control circuit on and disconnect only the supply voltage of the main circuit. Otherwise, the absolute position data will be lost.
CN5	Communication (USB)	Connector for a personal computer (PC)
CN8	STO connector	Connector for safety function (Safe Torque Off)

① Assignable symbols:

RD	ALM	INP	MBR	DB
TLC	WNG	BWNG	ZSP	CDPS
ABSV	SA	VLC	MTTR	CLDS

Meaning of symbols

The most important signals are explained in the table below. You will find detailed information about all signals in the instruction manual of the respective servo amplifier.

Signal	Symbol	Name	Description
Control terminals	Signal inputs	DI1	Devices can be assigned for these signals with controller setting. For devices that can be assigned, refer to the controller instruction manual. The following devices can be assigned for MR-J4 compatible controller (Q172DSCPU, Q173DSCPU, and QD77MS□).
		DI2	
		DI3	
		EM2	Forced stop 2 Turn off EM2 (open between commons) to decelerate the servo motor to a stop with commands. Turn EM2 on (short between commons) in the forced stop state to reset that state.
	Signal outputs	ALM	Alarm When the protective circuit is activated to shut off the base circuit, ALM will turn off. When an alarm does not occur, ALM will turn on after 2.5 s to 3.5 s after power-on.
		RD	Ready RD turns on when the servo is switched on and the servo amplifier is ready to operate.
		INP	In position INP turns on when the number of droop pulses is in the preset in-position range. The device cannot be used in the speed control mode, torque control mode, and for continuous operation to torque control mode.
		WNG	Warning When warning has occurred, WNG turns on. When a warning is not occurring, turning on the power will turn off WNG after 2.5 s to 3.5 s.
Analog terminals	Analog output	MO1	Analog monitor 1 Used to output the data set in parameter PC09 to across MO1–LG in terms of voltage.
		MO2	Analog monitor 2 Used to output the data set in parameter PC10 to across MO2–LG in terms of voltage.
Power supply	Common	DICOM	Input 24 V DC ($\pm 10\%$, 300 mA) to I/O interface For sink interface, connect + of 24 V DC external power supply. For source interface, connect – of 24 V DC external power supply.
		DOCOM	Common terminal of input signal such as EM2 of the servo amplifier. This is separated from LG. For sink interface, connect – of 24 V DC external power supply. For source interface, connect + of 24 V DC external power supply.
		LG	Common terminal of MO1 and MO2
		SD	Shielding, housing

Tab. 4-8: Selection of the most important input and output signals of CN3

4.2.3 Servo amplifier series MR-J4W-B

The shown front view is that of the MR-J4 3-axis servo amplifier (MR-J4W3-B). For the MR-J4 2-axis servo amplifier (MR-J4W2-B) connector CN2C is missing.

Fig. 4-5: MR-J4W-B signal arrangement

^① For the MR-J4 3-axis servo amplifier (MR-J4W3-B)

Signal assignment

Connector	Name	Description
CN1A	Connector for SSCNET III cable for previous servo amplifier axis	Used for connection with the controller or the servo amplifier of the previous axis.
CN1B	Connector for SSCNET III cable for next servo amplifier axis	Used for connection with the servo amplifier of the next axis. Put a cap on the CN1B connector of the final axis.
CN2A	Encoder connector	Connector for the servo motor encoder (axis A)
CN2B		Connector for the servo motor encoder (axis B)
CN2C ^①		Connector for the servo motor encoder (axis C)
CN3	I/O devices	Control interface (see tab. 4-10)
CN4	Battery terminal	For connecting the battery (the battery unit consists of the MR-BT6VCASE battery case and five MR-BAT6V1 batteries) to store the data of the absolute position detection (observe the following note). When you want to connect the battery, disconnect the power supply of the main circuit and wait for more than 15 minutes, after the charge lamp has gone off. When replacing the battery, leave the power supply of the control circuit on and disconnect only the supply voltage of the main circuit. Otherwise, the absolute position data will be lost.
CN5	Communication (USB)	Connector for a personal computer (PC)

- ^③ Initial device for C-axis, assignment with parameter PD07
The pin is not used for MR-J4 2-axis servo amplifiers.
- ^④ Initial device for A, B and C-axis, assignment with parameter PD08
- ^⑤ Initial device for A, B and C-axis, assignment with parameter PD09

Meaning of symbols

The most important signals are explained in the table below. You will find detailed information about all signals in the instruction manual of the respective servo amplifier.

Signal	Symbol ^①	Name	Description
Control terminals	Signal inputs	DI1-A	<p>Devices can be assigned for these signals with controller setting. For devices that can be assigned, refer to the controller instruction manual.</p> <p>The following devices can be assigned for MR-J4 compatible controller (Q172DSCPU, Q173DSCPU, and QD77MS□).</p> <p>DI1-A: FLS for A-axis (Upper stroke limit) DI2-A: RLS for A-axis (Lower stroke limit) DI3-A: DOG for A-axis (Proximity dog) DI1-B: FLS for B-axis (Upper stroke limit) DI2-B: RLS for B-axis (Lower stroke limit) DI3-B: DOG for B-axis (Proximity dog) DI1-C: FLS for C-axis (Upper stroke limit) DI2-C: RLS for C-axis (Lower stroke limit) DI3-C: DOG for C-axis (Proximity dog)</p>
		DI1-B	
		DI1-C	
		DI2-A	
		DI2-B	
		DI2-C	
		DI3-A	
		DI3-B	
		DI3-C	
		EM2	<p>Forced stop 2</p> <p>Turn off EM2 (open between commons) to decelerate the servo motor to a stop with commands. Turn EM2 on (short between commons) in the forced stop state to reset that state.</p>
	Signal outputs	ALM-A	
		ALM-B	<p>Alarm</p> <p>When the protective circuit is activated to shut off the base circuit, ALM will turn off. When an alarm does not occur, ALM will turn on about 3 s after power-on.</p>
		ALM-C	
		RD-A	<p>Ready</p> <p>Enabling servo-on to make the servo amplifier ready to operate will turn on RD.</p>
		RD-B	
		RD-C	
		INP-A	<p>In position</p> <p>When the number of droop pulses is in the preset in-position range, INP will turn on. The device cannot be used in the speed control mode, torque control mode, and for continuous operation to torque control mode.</p>
		INP-B	
		INP-C	
		WNG-A	<p>Warning</p> <p>When warning has occurred, WNG turns on. When a warning is not occurring, turning on the power will turn off WNG after about 3 s.</p>
		WNG-B	
		WNG-C	
Power supply	Common	DICOM	<p>Input 24 V DC (± 10%, MR-J4W2-□B: 350 mA, MR-J4W3-□B: 450 mA) to I/O interface</p> <p>For sink interface, connect + of 24 V DC external power supply.</p> <p>For source interface, connect – of 24 V DC external power supply.</p>
		DOCOM	<p>Common terminal of input signal such as EM2 of the servo amplifier. This is separated from LG.</p> <p>For sink interface, connect – of 24 V DC external power supply.</p> <p>For source interface, connect + of 24 V DC external power supply.</p>
		LG	Control common
		SD	Shielding, housing

Tab. 4-11: Selection of the most important input and output signals of CN3

① The last letter with hyphen in device symbols means the target axis.
(□□□ differs depending on devices)

□□□-A: Device for A-axis
□□□-B: Device for B-axis
□□□-C: Device for C-axis

This device is not used for MR-J4 2-axis servo amplifiers.

4.3 Wiring the interfaces

4.3.1 I/O interfaces in negative logic (sink type)

Digital input interface DI-1

This is an input circuit whose photocoupler cathode side is the input terminal. Transmit signals from sink (open-collector) type transistor output, relay switch, etc.

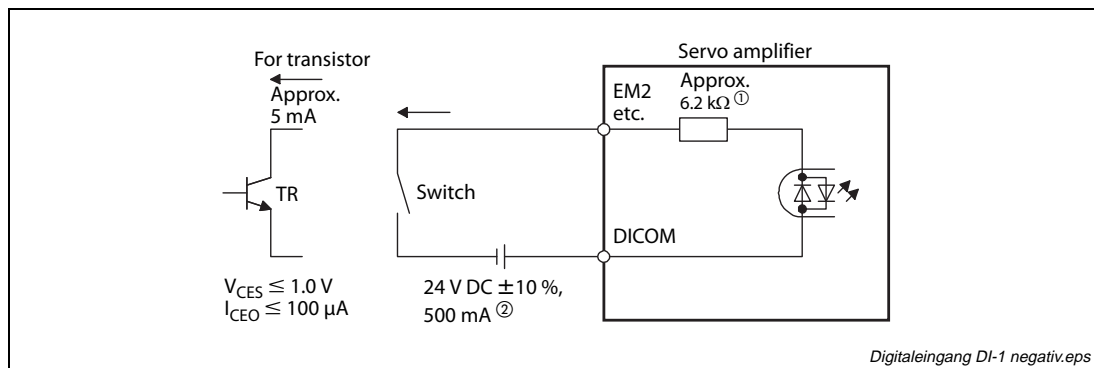

Fig. 4-6: Example

① MR-J4W□-□B: Approximately 5.6 kΩ

② MR-J4-□B: 300 mA, MR-J4W2-□B: 350 mA, MR-J4W3-□B: 450 mA

Digital output interface DO-1

This is a circuit of collector output terminal of the output transistor. When the output transistor is turned on, collector terminal current will be applied for the output.

A lamp, relay or photocoupler can be driven. Install a diode (D) for an inductive load, or install an inrush current suppressing resistor (R) for a lamp load.

(Rated current: 40 mA or less, maximum current: 50 mA or less, inrush current: 100 mA or less)

A maximum of 2.6 V voltage drop occurs in the servo amplifier.

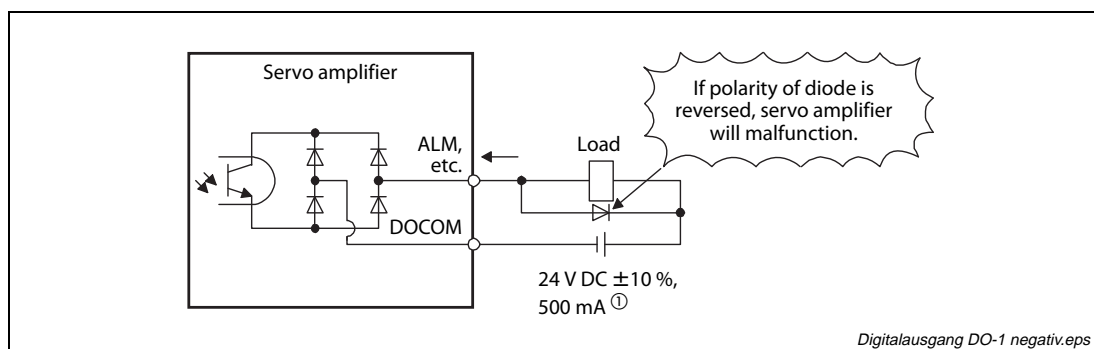

Fig. 4-7: Example

① MR-J4-□B: 300 mA, MR-J4W2-□B: 350 mA, MR-J4W3-□B: 450 mA

If the voltage drop (maximum of 2.6 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

WARNING:

When connecting an inductive load, please observe the right polarity of the recovery diode. Wrong polarity of the diode can damage the servo amplifier.

4.3.2 I/O interfaces in positive logic (source type)

In this servo amplifier, source type I/O interfaces can be used.

Digital input interface DI-1

This is an input circuit whose photocoupler anode side is the input terminal. Transmit signals using source (open-collector) type transistor output, relay switch, etc.

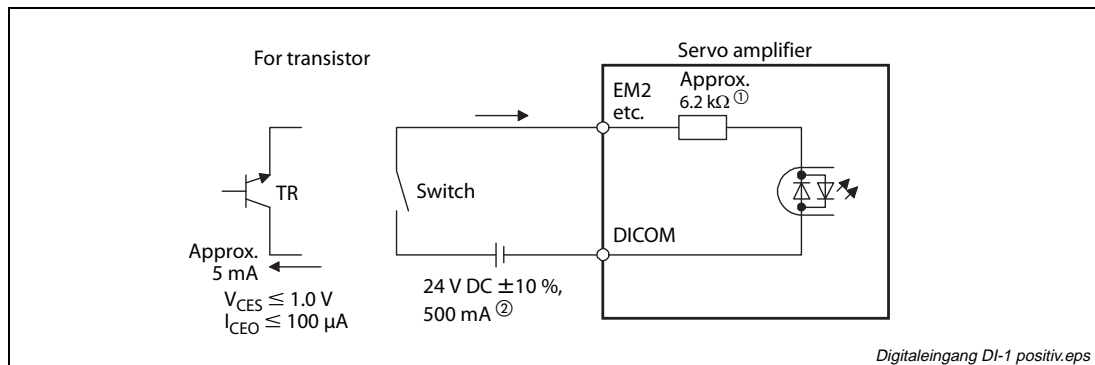

Fig. 4-8: Example

① MR-J4W□-□B: Approximately 5.6 kΩ

② MR-J4-□B(-RJ): 300 mA, MR-J4W2-□B: 350 mA, MR-J4W3-□B: 450 mA

Digital output interface DO-1

This is a circuit in which the emitter side of the output transistor is the output terminal. When the output transistor is turned on, the current flows from the output terminal to a load. A maximum of 2.6 V voltage drop occurs in the servo amplifier.

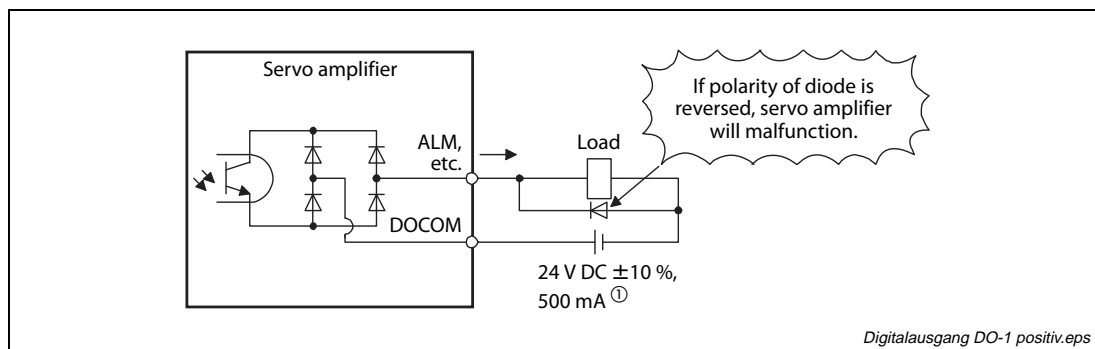

Fig. 4-9: Example

① MR-J4-□B(-RJ): 300 mA, MR-J4W2-□B: 350 mA, MR-J4W3-□B: 450 mA

If the voltage drop (maximum of 2.6 V) interferes with the relay operation, apply high voltage (maximum of 26.4 V) from external source.

WARNING:

When connecting an inductive load, please observe the right polarity of the recovery diode. Wrong polarity of the diode can damage the servo amplifier.

4.3.3 Analog interfaces

Analog input (only MR-J4-A(-RJ))

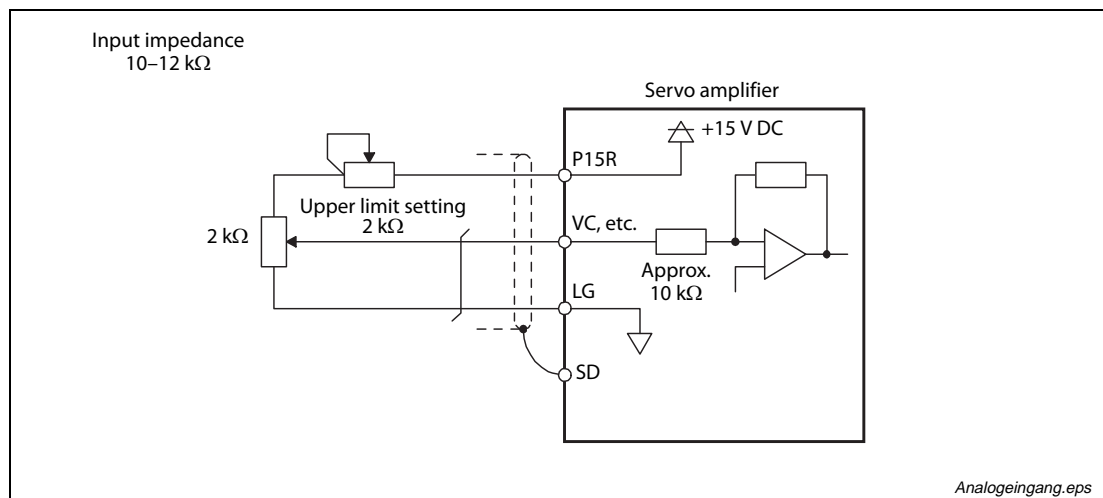

Fig. 4-10: Example

Analog output (only MR-J4-A(-RJ) and MR-J4-B(-RJ))

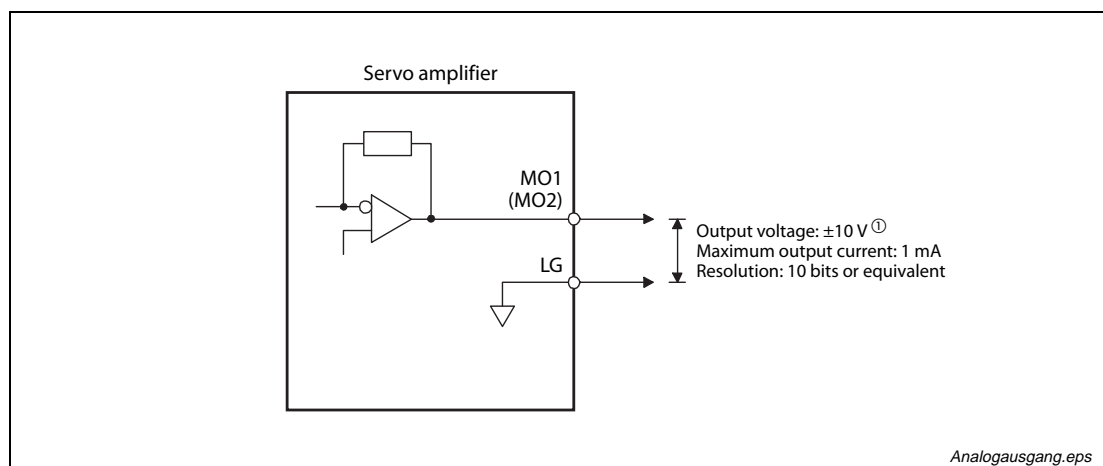

Fig. 4-11: Example

- ① Output voltage range varies depending on the monitored signal.

4.4 Communication function

NOTE

The USB communication function (CN5 connector) and the RS-422 communication function (CN3 connector) are mutually exclusive functions. They cannot be used together.

4.4.1 Serial interface RS-422 (only MR-J4-A(-RJ))

You can operate servo driving, parameter change, monitor function, etc. using RS-422 serial communication function with the servo amplifier.

● Single axis

Operate the single-axis servo amplifier. It is recommended to use the following cable.

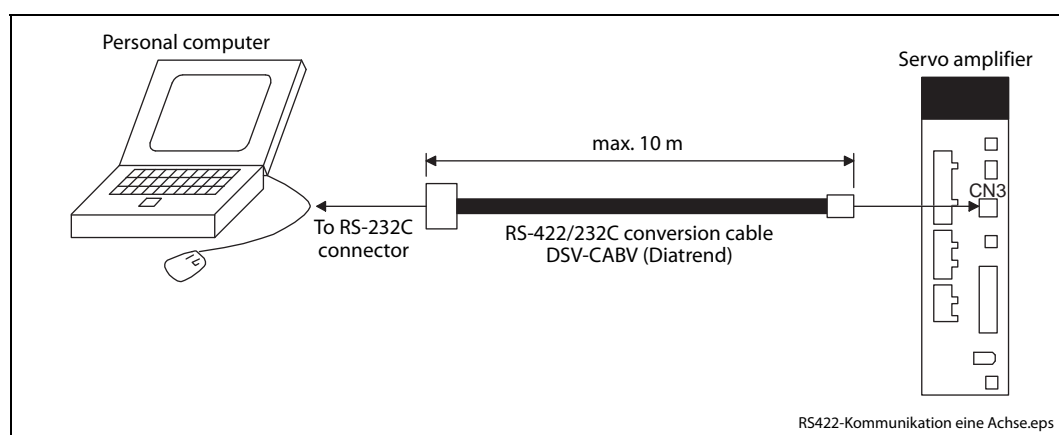

Fig. 4-12: System configuration with the RS-422 interface for operation with one axis

● Multi-drop connection

Up to 32 axes of servo amplifiers from stations 0 to 31 can be operated on the same bus.

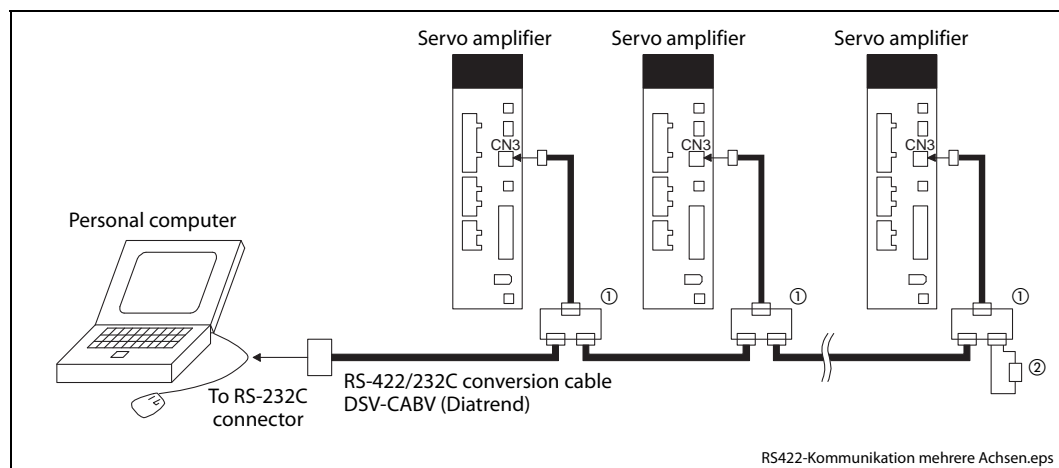

Fig. 4-13: System configuration with the RS-422 interface for operation with multiple axes

- ① The BMJ-8 (Hachiko Electric) is recommended as the branch connector.
- ② The final axis must be terminated between RDP (pin No. 3) and RDN (pin No. 6) on the receiving side (servo amplifier) with a 150 Ω resistor.

4.4.2 USB interface

The servo amplifiers of the MR-J4 series have a USB communication interface. Therefore, you can connect the servo amplifier to the personal computer with MR Configurator2 installed to perform the parameter setting, test operation, gain adjustment, and others.

Fig. 4-14: Connection for USB communication

Note that using the USB communication function (CN5 connector) prevents the RS-422 communication function (CN3 connector) from being used, and vice versa. They cannot be used together.

4.5 Optical interface SSCNET III (only MR-J4-B(-RJ) and MR-J4W-B)

The servo amplifiers MR-J4-B(-RJ) and MR-J4W-B have an optical interface SSCNET III (CN1A, CN1B). Operation and monitoring of the servo amplifier can be done by the motion CPU.

WARNING:

Do not see directly the light generated from CN1A and CN1B connector of servo amplifier or the end of SSCNET III cable. When the light gets into eye, may feel something is wrong for eye. (The light source of SSCNET III complies with class1 defined in JIS C6802 or IEC60825-1.)

The SSCNET III cable of the HOST controller (motion CPU) or of the preceding servo amplifier is plugged into connector CN1A. The SSCNET III cable to the next servo amplifier is plugged into terminal CN1B. For CN1B connector of the final axis, put the cap on, which came with the servo amplifier.

Fig. 4-15: SSCNET III cable connection for MR-J4-B(-RJ)

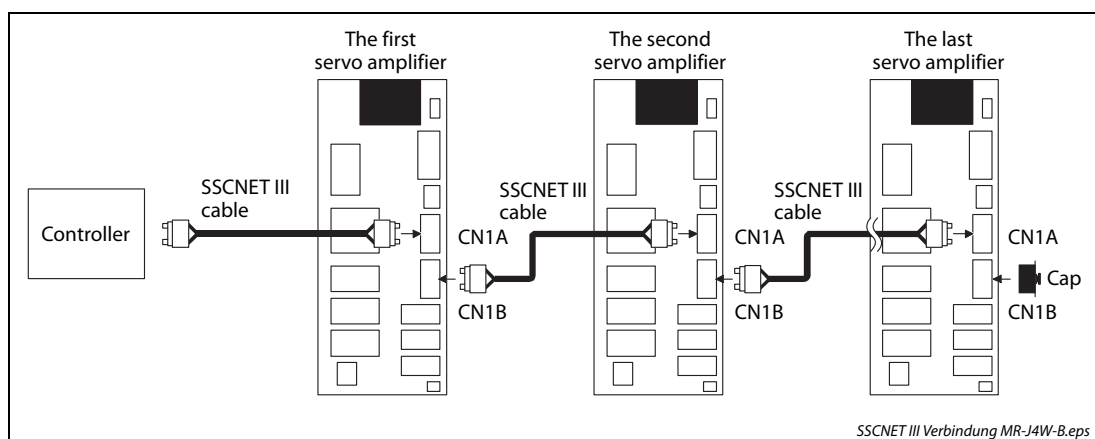

Fig. 4-16: SSCNET III cable connection for MR-J4W-B

NOTES

Put a cap on CN1A and CN1B connector to protect the light device inside the connector from dust. For this reason, do not remove a cap until just before mounting the SSCNET III cable. Then, when removing SSCNET III cable, make sure to put a cap on.

Keep the cap for CN1A and CN1B connector and the tube for protecting the end of SSCNET III cable in a plastic bag with a zipper to prevent them from becoming dirty.

When asking repair of servo amplifier for some troubles, make sure to put a cap on CN1A and CN1B connector. When the connector is not protected by a cap, the light device may be damaged at the transit. In this case, exchange and repair of light device is required.

SSCNET III cable with open ends (e.g. after disassembly of a defective servo amplifier) should be covered immediately with the protective tube to prevent damage.

4.6 Setting the control axis number (only MR-J4-B(-RJ) and MR-J4W-B)

You can set the control axis number between 1 and 64 by using auxiliary axis number setting switches with the axis selection rotary switch. If the same numbers are set to different control axes in a single communication system, the system will not operate properly. The control axes may be set independently of the SSCNET III cable connection sequence. The following shows the description of each switch.

4.6.1 MR-J4-B(-RJ)

Fig. 4-17:
Switches for setting the control axis number (MR-J4-B(-RJ))

MR-J4-B_Front_controls.eps

Auxiliary axis number setting switches (SW2-3 and SW2-4)

Turning these switches "ON (up)" enables you to set the axis No. 17 or more.

Axis selection rotary switch (SW1)

You can set the control axis number between 1 and 64 by using auxiliary axis number setting switches with the axis selection rotary switch.

Fig. 4-18:
Rotary switch (SW1)

Rotary switch SW1.eps

WARNING:

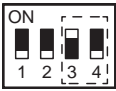

- When switching the axis selection rotary switch (SW1) and auxiliary axis number setting switch (SW2), use insulated screw driver. Do not use a metal screw driver. Touching patterns on electronic boards, lead of electronic parts, etc. may cause an electric shock.
- For setting the axis selection rotary switch, use a flat-blade screwdriver with the blade edge width of 2.1 mm to 2.3 mm and the blade edge thickness of 0.6 mm to 0.7 mm.

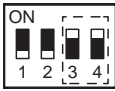

Switch combination list for the control axis No. setting

The following lists show the setting combinations of the auxiliary axis number setting switches and the axis selection rotary switch.

Auxiliary axis number setting switch	Axis selection rotary switch	Control axis number

Tab. 4-14: Switch combinations for setting the control axis numbers for axes A, B and C (MR-J4W3-B)

- ① When C-axis is set as disabled-axis, A-axis is used as 63 axes and B-axis is used as 64 axes. When C-axis is not set as disabled-axis, AL. 11 "Switch setting error" occurs.
- ② When B-axis and C-axis are set as disabled-axes, A-axis is used as 64 axes. When B-axis and C-axis are not set as disabled-axes, AL. 11 "Switch setting error" occurs.

4.7 Disabling of control axes (only MR-J4W-B)

Turning “ON (up)” a disabling control axis switch disables the corresponding servo motor. The servo motor will be disabled-axis status and will not be recognized by the controller. The following shows the disabling control axis switches for each axis.

Fig. 4-21: Switches SW2-2, SW2-3, and SW2-4 for disabling control axes

Disable the axis that you do not use. Set them from the last axis to the first axis in order. When only the first axis is disabled, AL. 11 “Switch setting error” occurs. The following lists show the enabled axes that the controller recognizes and the disabled axes that the controller do not recognize.

MR-J4 2-axis servo amplifier			MR-J4 3-axis servo amplifier

Tab. 4-15: Enabling and disabling of axes for MR-J4W2-B and MR-J4W3-B

- ✓: Enabled
- : Disabled

WARNING:
When switching the axis selection rotary switch (SW1) and auxiliary axis number setting switch (SW2), use insulated screw driver. Do not use a metal screw driver. Touching patterns on electronic boards, lead of electronic parts, etc. may cause an electric shock.

4.8 Servo motor

4.8.1 Connecting the servo motor

WARNING:

- **Ground the servo amplifier and servo motor securely. To prevent an electric shock, always connect the protective earth (PE) terminal (terminal marked with \perp) of the servo amplifier with the protective earth (PE) of the control box.**
- **Connect the wires to the correct phase terminals (U, V, W) of the servo amplifier and servo motor. Otherwise, the servo motor will operate improperly.**
- **Do not connect AC power supply directly to the servo motor. Otherwise, a fault may occur.**

The servo amplifier switches the power transistor on-off to supply power to the servo motor. Depending on the wiring and ground cable routing, the servo amplifier may be affected by the switching noise (due to di/dt and dv/dt) of the transistor. To prevent such a fault, refer to the following diagram and always ground.

To conform to the EMC Directive, refer to the EMC Installation Guidelines (IB(NA)67310).

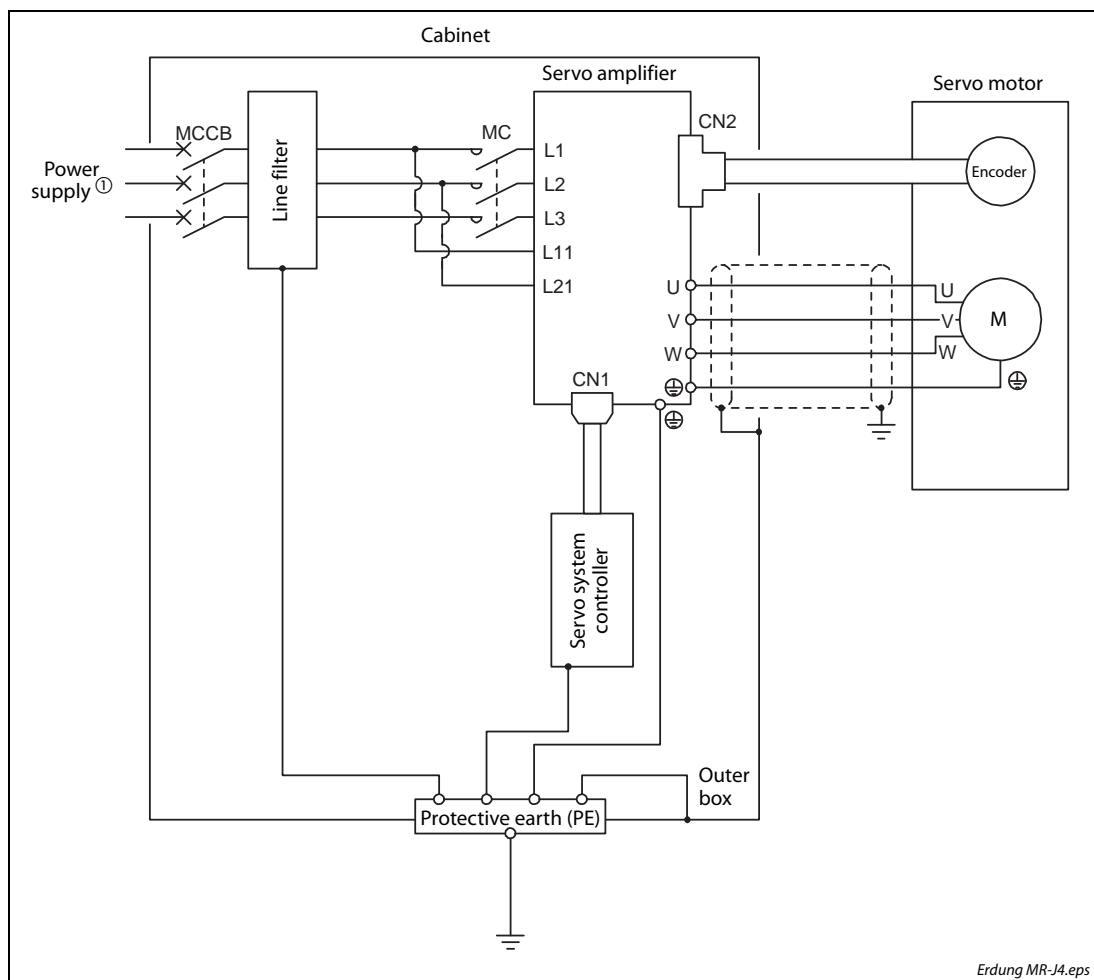

Fig. 4-22: Grounding of the servo amplifier MR-J4-A or MR-J4-B

- ① For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. For power supply specifications, refer to section 4.1.

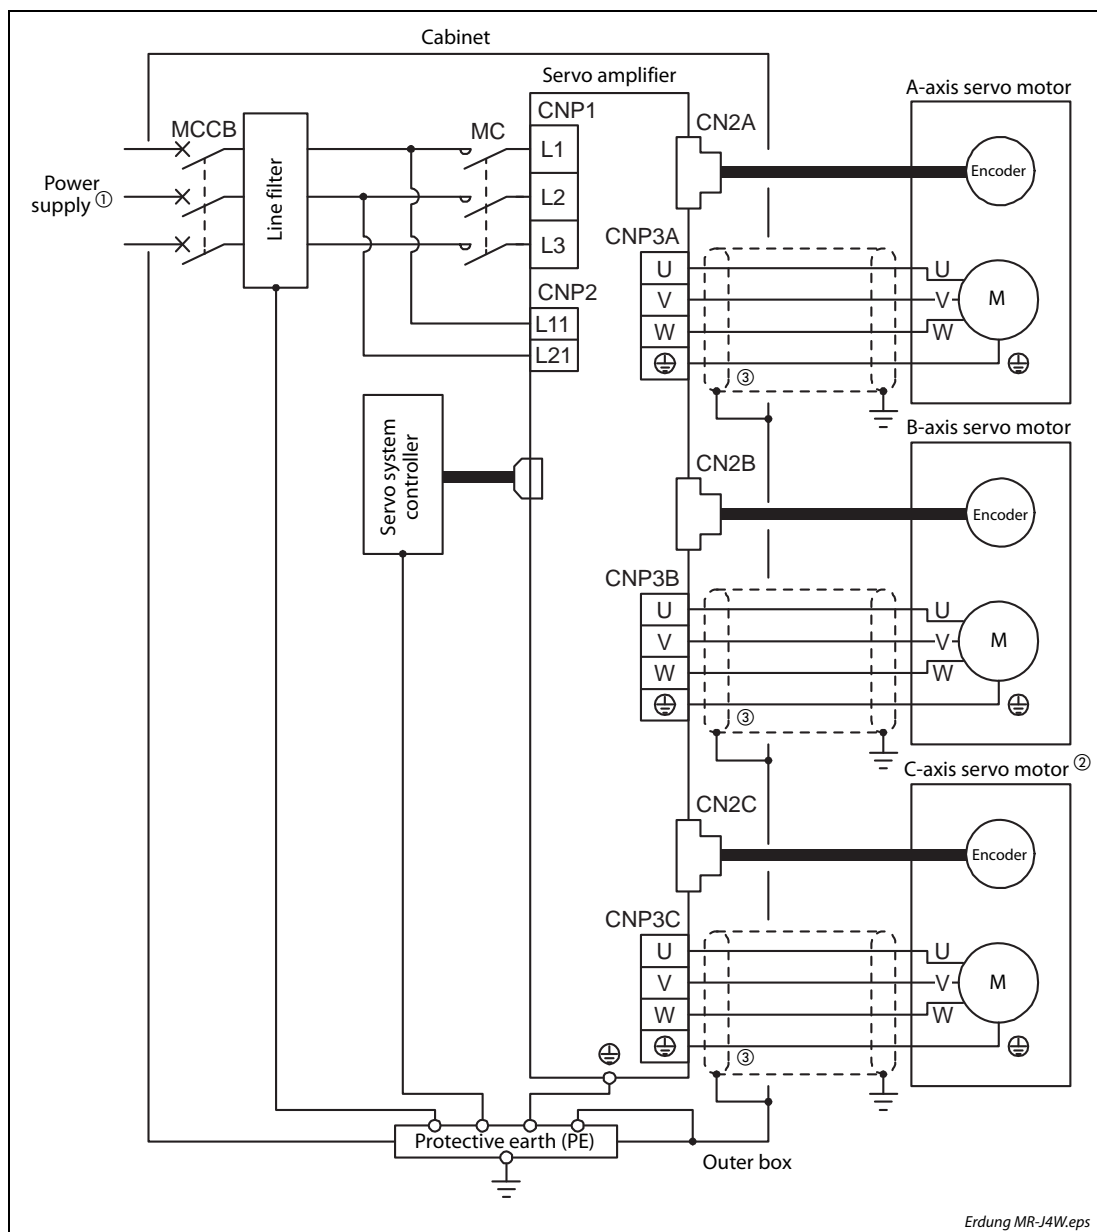

Fig. 4-23: Grounding of the servo amplifier MR-J4W2-B or MR-J4W3-B

- ① For power supply specifications, refer to section 4.1.
- ② For the MR-J4 3-axis servo amplifier (MR-J4W3-B)
- ③ Be sure to connect it to \perp of CNP3A, CNP3B, and CNP3C. Do not connect the wire directly to the protective earth of the cabinet.

4.8.2 Servo motor with electromagnetic brake

WARNING:

- **Configure an electromagnetic brake circuit so that it is activated also by an external EMG stop switch.**
- **The electromagnetic brake is provided for holding purpose and must not be used for ordinary braking.**
- **Before operating the servo motor, be sure to confirm that the electromagnetic brake operates properly.**
- **Do not use the 24 V DC interface power supply for the electromagnetic brake. Always use the power supply designed exclusively for the electromagnetic brake. Otherwise, it may cause a malfunction.**

Note the following when the servo motor with an electromagnetic brake is used.

- ① The brake will operate when the power (24 V DC) turns off.
- ② The status is base circuit shut-off during RES (Reset) on. When you use the motor in vertical axis system, use MBR (Electromagnetic brake interlock).
- ③ Turn off SON (Servo-on) after the servo motor stopped.

Connection diagram

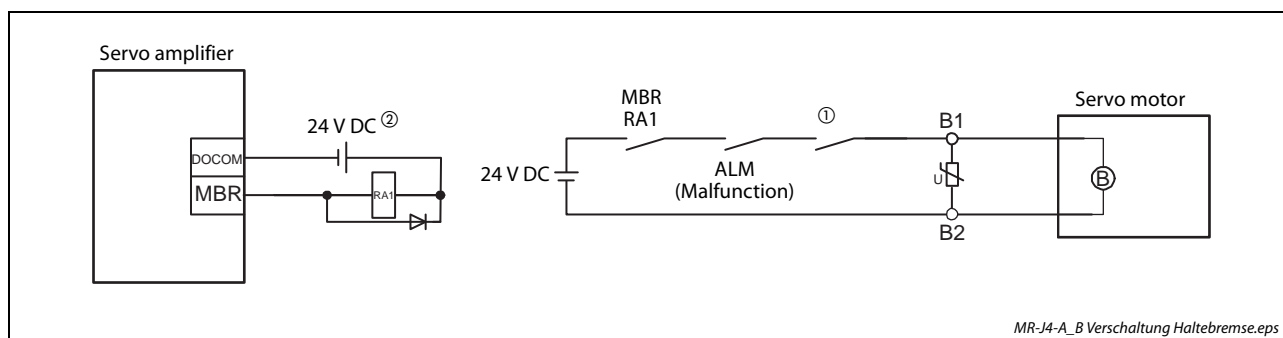

Fig. 4-24: Wiring of the electromagnetic brake for MR-J4-A(-RJ) and MR-J4-B(-RJ)

- ① Create the circuit in order to shut off by interlocking with the emergency stop switch.
- ② Do not use the 24 V DC interface power supply for the electromagnetic brake.

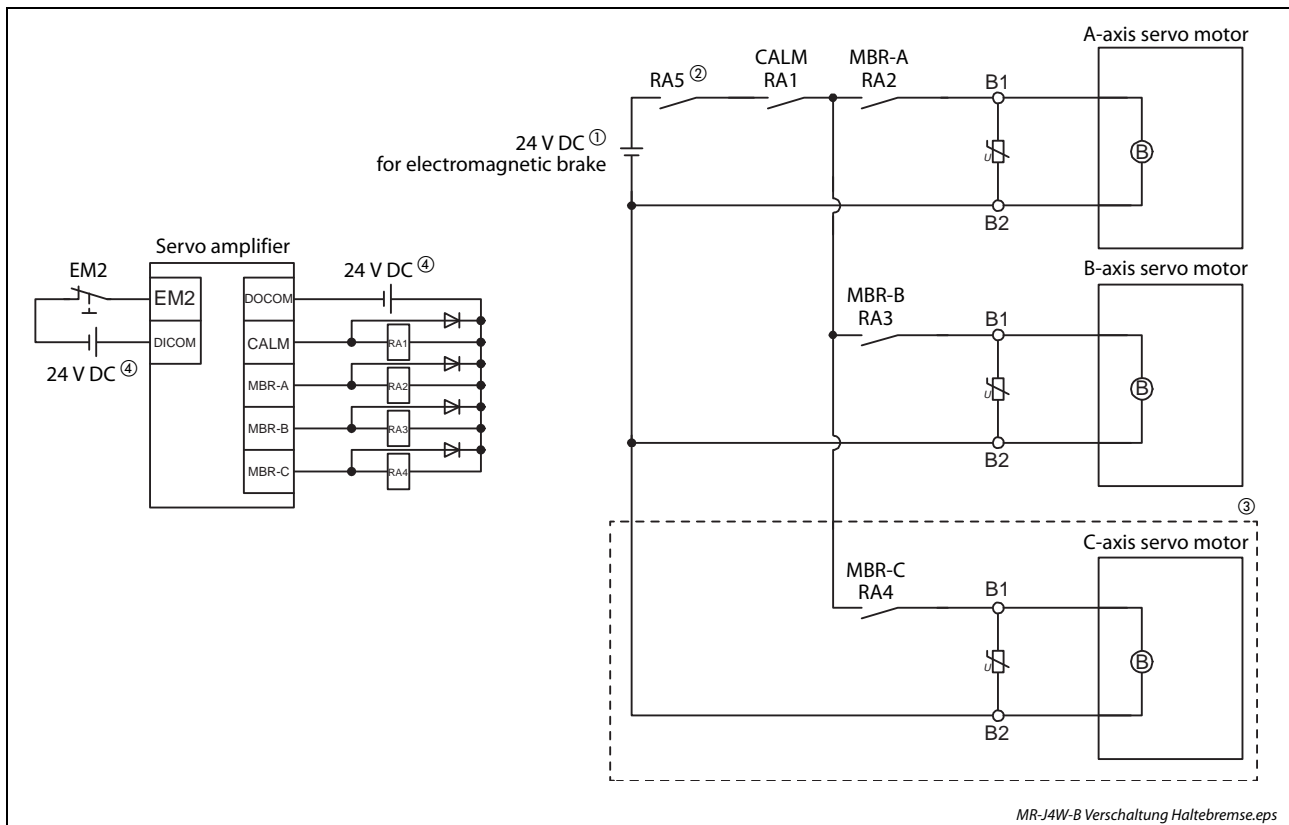

Fig. 4-25: Wiring of the electromagnetic brake for MR-J4W-B

- ① Do not use the 24 V DC interface power supply for the electromagnetic brake.
- ② Create the circuit in order to shut off by interlocking with the emergency stop switch.
- ③ This connection is for the MR-J4 3-axis servo amplifier.
- ④ The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

4.9 Forced stop

NOTES

When alarms not related to the forced stop function occur, control of motor deceleration can not be guaranteed.

When SSCNET III/H communication brake occurs, forced stop deceleration will operate (only MR-J4(W)-B).

In the torque control mode, the forced stop deceleration function is not available.

4.9.1 Forced stop deceleration function

When EM2 is turned off, dynamic brake will start to stop the servo motor after forced stop deceleration. During this sequence, the display shows AL. E6 "Servo forced stop warning".

During normal operation, do not use EM2 (Forced stop 2) to alternate stop and drive. The servo amplifier life may be shortened.

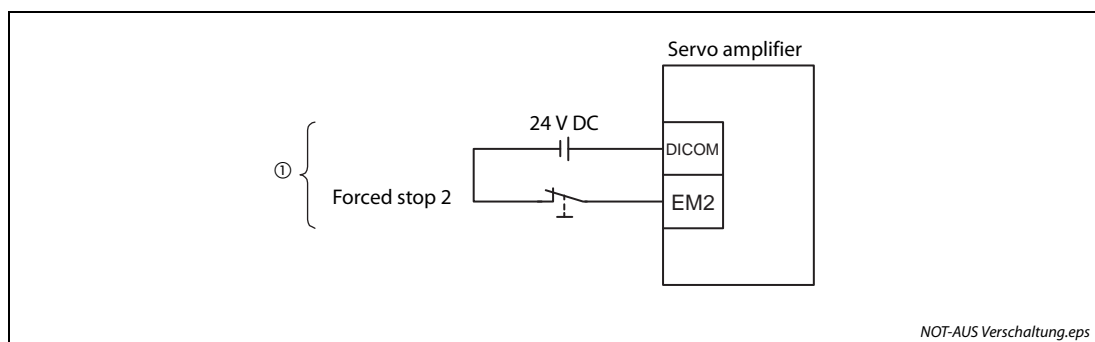

Fig. 4-26: Emergency switch

① This diagram is for sink I/O interface. For source I/O interface, refer to section 4.3.2.

4.10 Wiring examples

Wire the power supply/main circuit as shown below. Connect the 1-phase 200 V AC to 240 V AC power supply to L1 and L3. One of the connecting destinations is different from MR-J3 Series Servo Amplifier's. When using MR-J4 as a replacement for MR-J3, be careful not to connect the power to L2.

Configure the wirings so that the main circuit power supply is shut off and SON (Servo-on) is turned off after deceleration to a stop due to an alarm occurring, enabled servo forced stop, etc. A molded-case circuit breaker (MCCB) must be used with the input cables of the main circuit power supply.

NOTE

One model of the servo amplifier series MR-J4-A(-RJ), MR-J4-B(-RJ) and MR-J4W-B is only shown in the wiring examples. Please refer to the respective user manual for the wiring of other servo amplifier models.

4.10.1 Servo amplifier series MR-J4-A(-RJ)

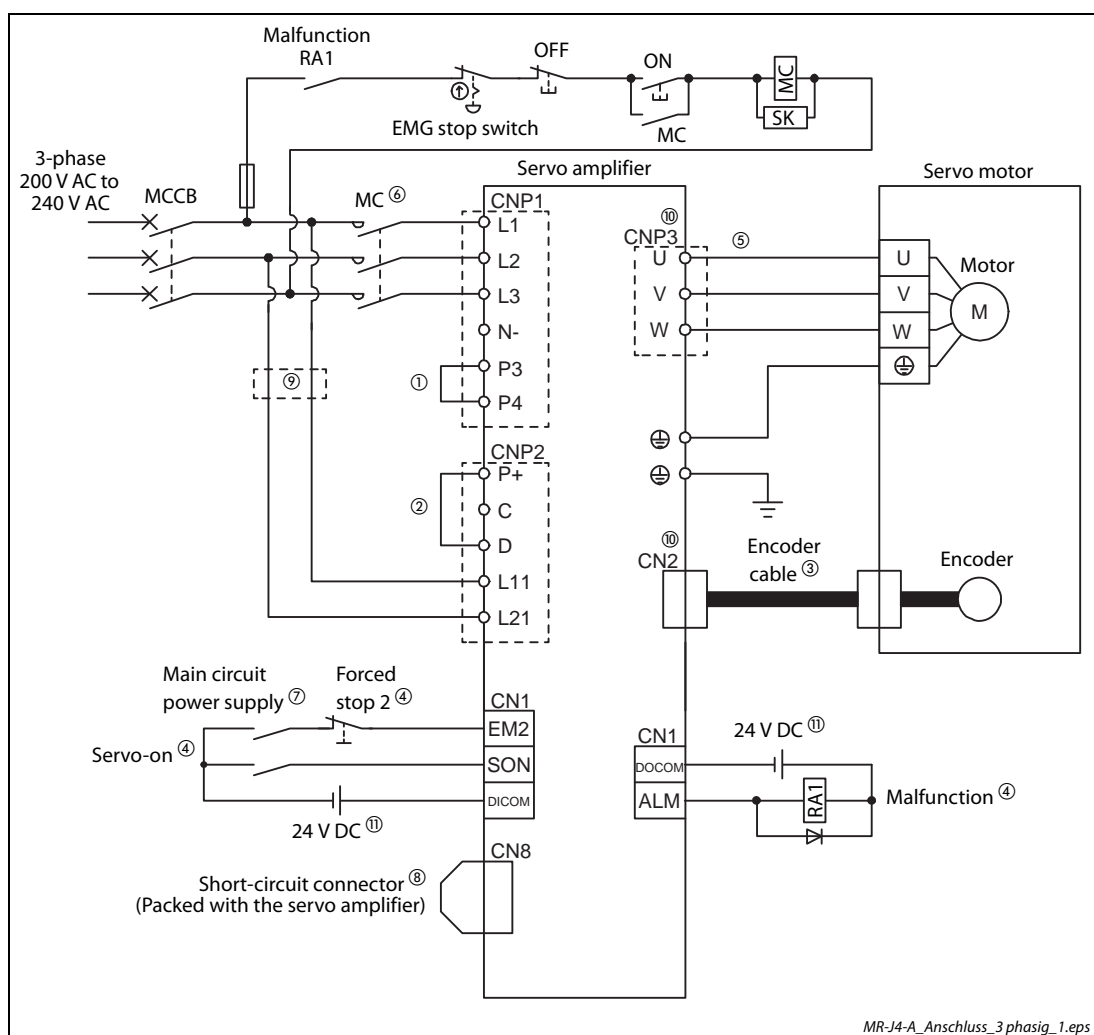

Fig. 4-27: Wiring of servo amplifier MR-J4-10A(-RJ) to MR-J4-350A(-RJ)

- ① Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Refer to the instruction manual for details. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- ② Always connect between P+ and D terminals (factory-wired). When using the regenerative option, refer to the instruction manual.

- ③ For the encoder cable, use of the option cable is recommended. For selecting cables, refer to "Servo Motor Instruction Manual (Vol. 3)".
- ④ This diagram shows sink I/O interface. For source I/O interface, refer to section 4.3.2.
- ⑤ For connecting servo motor power wires, refer to "Servo Motor Instruction Manual (Vol. 3)".
- ⑥ Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- ⑦ Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- ⑧ When not using the STO function, attach the short-circuit connector came with a servo amplifier.
- ⑨ When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker. (Refer to the instruction manual.)
- ⑩ Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- ⑪ The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

Fig. 4-28: System configuration for MR-J4-20A-RJ

- ① The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- ② A 1-phase 200 V AC to 240 V AC power supply may be used with the servo amplifier of MR-J4-70A(-RJ) or less. For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. For the power supply specifications, refer to section 4.1.
- ③ Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- ④ This is for the MR-J4-□A-RJ servo amplifier. The MR-J4-□A servo amplifier does not have the CN2L connector. When using an MR-J4-□A-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the "Linear Encoder Instruction Manual" for the compatible external encoders.

4.10.2 Servo amplifier series MR-J4-B(-RJ)

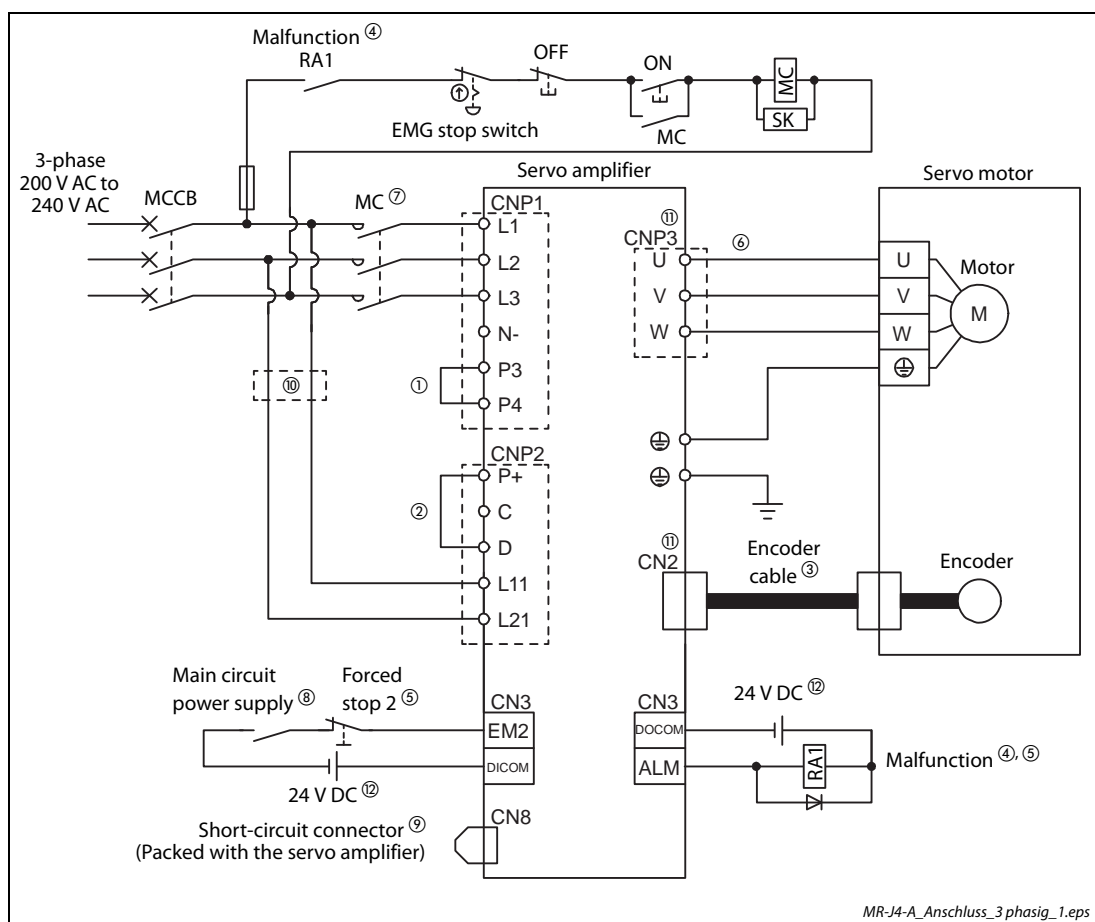

Fig. 4-29: Wiring of servo amplifier MR-J4-10B(-RJ) to MR-J4-350B(-RJ)

- ① Between P3 and P4 is connected by default. When using the power factor improving DC reactor, remove the short bar between P3 and P4. Refer to the instruction manual for details. Additionally, a power factor improving DC reactor and power factor improving AC reactor cannot be used simultaneously.
- ② Always connect between P+ and D terminals. (factory-wired) When using the regenerative option, refer to the instruction manual.
- ③ For the encoder cable, use of the option cable is recommended. For selecting cables, refer to "Servo Motor Instruction Manual (Vol. 3)".
- ④ If disabling ALM (Malfunction) output with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.
- ⑤ This diagram is for sink I/O interface. For source I/O interface, refer to section 4.3.2.
- ⑥ For connecting servo motor power wires, refer to "Servo Motor Instruction Manual (Vol. 3)".
- ⑦ Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- ⑧ Configure a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- ⑨ When not using the STO function, attach the short-circuit connector came with a servo amplifier.

- ⑩ When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker. (Refer to the instruction manual.)
- ⑪ Connecting a servo motor of the wrong axis to U, V, W, or CN2 of the servo amplifier may cause a malfunction.
- ⑫ The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

Fig. 4-30: System configuration for MR-J4-20B-RJ

- ① The power factor improving AC reactor can also be used. In this case, the power factor improving DC reactor cannot be used. When not using the power factor improving DC reactor, short P3 and P4.
- ② A 1-phase 200 V AC to 240 V AC power supply may be used with the servo amplifier of MR-J4-70B(-RJ) or less. For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. Refer to section 4.1 for the power supply specifications.
- ③ Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- ④ This is for MR-J4-□B-RJ servo amplifier. MR-J4-□B servo amplifier does not have CN2L connector. When using MR-J4-□B-RJ servo amplifier in the linear servo system or in the fully closed loop system, connect an external encoder to this connector. Refer to the "Linear Encoder Instruction Manual" for the compatible external encoders.

4.10.3 Multi axes servo amplifier series MR-J4W-B

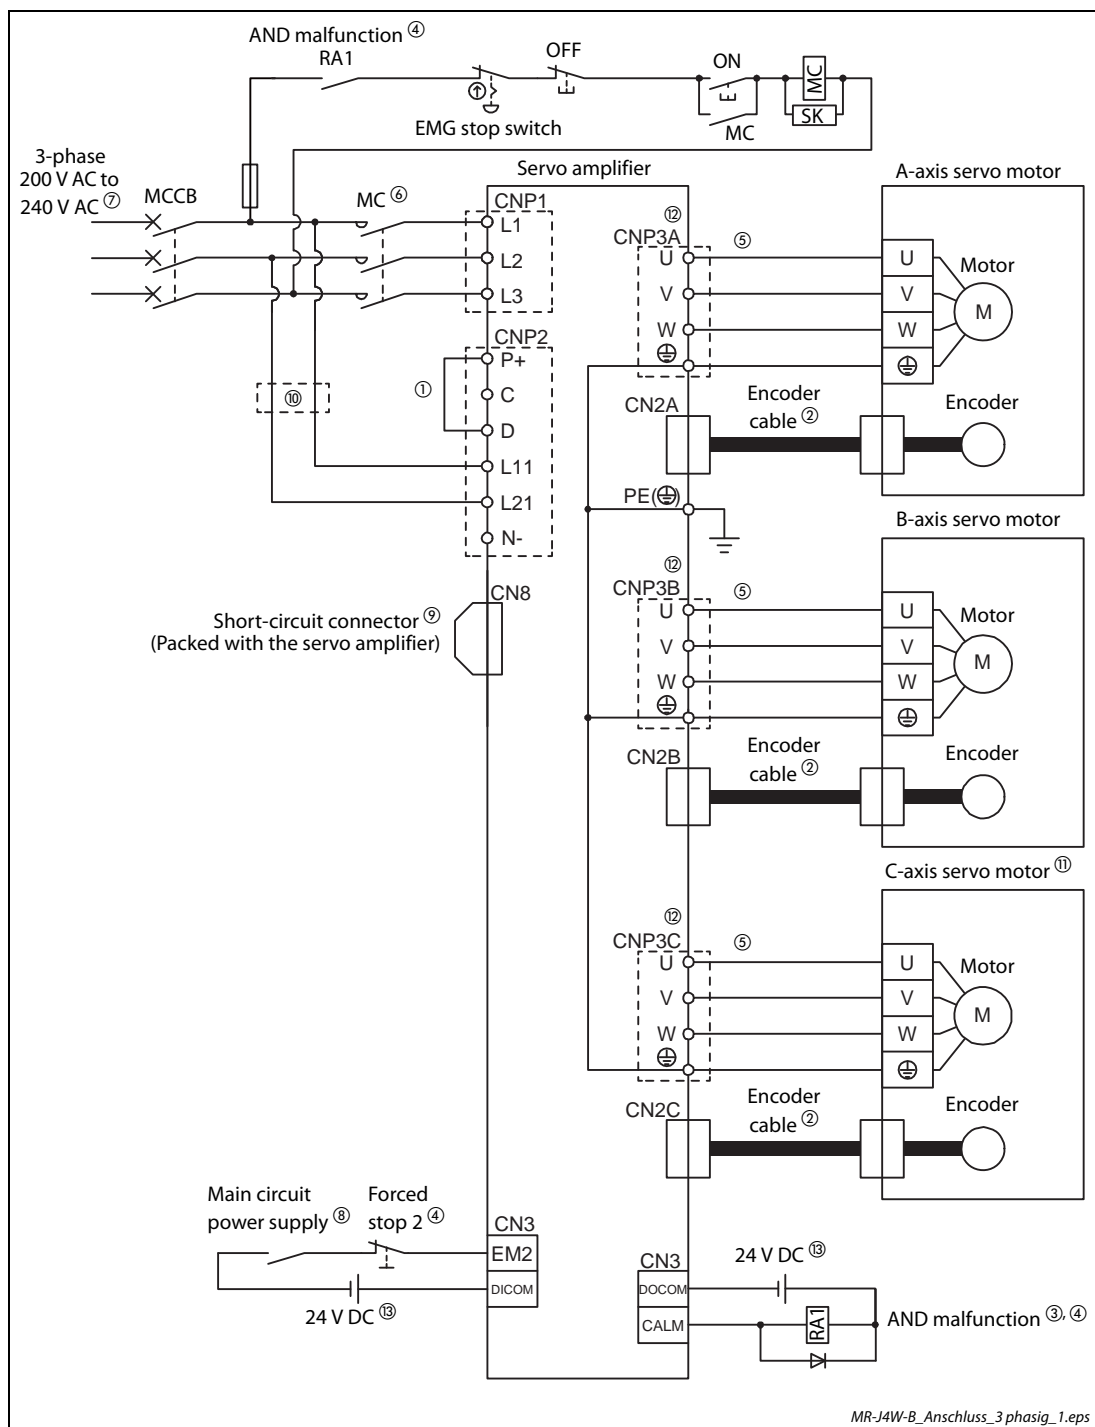

Fig. 4-31: Wiring of servo amplifier MR-J4W-B

- ① Between P+ and D is connected by default. When using the regenerative option, refer to the instruction manual.
- ② For the encoder cable, use of the option cable is recommended. For selecting cables, refer to "Servo Motor Instruction Manual (Vol. 3)".
- ③ This circuit is an example of stopping all axes when an alarm occurs. If disabling CALM (AND malfunction) output with the parameter, configure up the power supply circuit which switches off the magnetic contactor after detection of alarm occurrence on the controller side.
- ④ This diagram is for sink I/O interface. For source I/O interface, refer to section 4.3.2.

- ⑤ For connecting servo motor power wires, refer to "Servo Motor Instruction Manual (Vol. 3)".
- ⑥ Use a magnetic contactor with an operation delay time (interval between current being applied to the coil until closure of contacts) of 80 ms or less. Depending on the main circuit voltage and operation pattern, bus voltage decreases, and that may cause the forced stop deceleration to shift to the dynamic brake deceleration. When dynamic brake deceleration is not required, slow the time to turn off the magnetic contactor.
- ⑦ For 1-phase 200 V AC to 240 V AC, connect the power supply to L1 and L3. Leave L2 open. Refer to section 4.1 for the power supply specifications.
- ⑧ Configure up a circuit to turn off EM2 when the main circuit power is turned off to prevent an unexpected restart of the servo amplifier.
- ⑨ When not using the STO function, attach a short-circuit connector supplied with a servo amplifier.
- ⑩ When wires used for L11 and L21 are thinner than wires used for L1, L2, and L3, use a molded-case circuit breaker (refer to the instruction manual).
- ⑪ For the MR-J4 3-axis servo amplifier
- ⑫ Connecting a servo motor for different axis to the CNP3A, CNP3B, or CN3C connector may cause a malfunction.
- ⑬ The illustration of the 24 V DC power supply is divided between input signal and output signal for convenience. However, they can be configured by one.

4.11 EM-Compatible Installation

Fast switching of electrical currents and voltages, which naturally also occurs when servo amplifiers are used, generates radio frequency interference (RF noise) that can be propagated both along cables and through the air. The power and signal cables of the servo amplifier can act as noise transmission antennas. Because of this the cabling work needs to be performed with the utmost care. The cables connecting the servo amplifier and the motor are a particularly powerful source of potential interference.

In the European Union several EMC (electromagnetic compatibility) directives have been passed with regulations for the limitation of interference generated by variable-speed drive systems. To conform to these regulations you must observe some basic guidelines when you are planning, installing and wiring your systems:

- To reduce noise radiation install the equipment in a closed and properly earthed switchgear cabinet made of metal.
- Ensure that everything is properly earthed.
- Use shielded cables.
- Install sensitive equipment as far away as possible from interference sources or install the interference sources in a separate switchgear cabinet.
- Keep signal and power cables separate. Avoid routing interference-suppressed cables (e.g. power supply cables) and interference-prone cables (e.g. shielded motor cables) together for more than short distances.

4.11.1 EM-compatible switchgear cabinet installation

The design of the switchgear cabinet is critical for compliance with the EMC directives. Please follow the following guidelines:

- Use an earthed cabinet made of metal.
- Use conductive seals between the cabinet door and chassis and connect the door and the chassis with a thick, braided earth cable.
- If an EMC filter is installed make sure that it has a good electrically conductive connection to the installation panel (remove paint etc). Ensure that the base on which the equipment is installed is also properly connected to the switchgear cabinet earth.
- All cabinet plates should be welded or screwed together not more than 10 cm apart to limit transparency to RF noise. The diameters of any openings and cable glands in the cabinet should not exceed 10 cm and there should not be any unearthed components anywhere in the cabinet. If larger openings are required they must be covered with wire mesh. Always remove paint etc. between all metal-on-metal contacts to ensure good conductivity for example between the wire mesh covers and the cabinet.
- If servo amplifiers and controllers must be installed in the same cabinet they should be kept as far away from one another as possible. It is better to use separate cabinets if possible. If you must install everything in a single cabinet you can separate the servo amplifiers and controllers with a metal panel.
- Earth the installed equipment with short, thick earth conductors or suitable earthing strips. Earthing strips with a large surface area are better for earthing RFI signals than equipotential bonding conductors with large cross-sections.

4.11.2 Wiring

All analog and digital signal cables should be shielded or routed in metal cable conduits.

At the entrance point to the chassis run the cable through a metal cable gland or fasten it with a P or U type cable clamp, connecting the shielding to the earth either with the gland or the clamp (see illustration below). If you use a cable clamp install it as near as possible to the cable entry point to keep the distance to the earthing point as short as possible. To keep the unshielded portion of the cable (RFI transmission antenna!) as short as possible ensure that the end of the motor cable shielding is as close as possible to the connection terminal without causing a risk of earth faults or short circuits.

When using a P or U clamp make sure that the clamp is installed cleanly and that it does not pinch the cable more than necessary.

Route control signal cables at least 30 cm away from all power cables. Do not route the power supply cables or the cables connecting the servo amplifier and the motor in parallel to control signal cables, telephone cables or data cables.

If possible, all control signal cables to and from the servo amplifier should only be routed inside the earthed switchgear cabinet. If routing control signal cables outside the cabinet is not possible always use shielded cables, as signal cables can also function as antennas. The shielding of the cables must always be earthed. To prevent corruption of sensitive analog signals (e.g. the 0–5 V analog frequency setting signal) by currents circulating in the earthing system it may be necessary to earth only one end of the cable shielding. In such cases always earth the shielding at the servo amplifier end of the cable.

Installation of standard ferrite cores on the signal cables can further improve RFI suppression. The cable should be wound around the core several times and the core should be installed as close to the servo amplifier as possible.

Motor connection cables should always be as short as possible. Long cables can sometimes trigger earth fault protection mechanisms. Avoid unnecessarily long cables and always use the shortest possible route for the cables.

It should go without saying that the motor itself should also be properly earthed.

4.11.3 Optional EMC filters

EMC filters (mains RFI suppression filters) significantly reduce interference. They are installed between the mains power supply and the servo amplifier of the MR-J4 series.

Wiring 1-phase

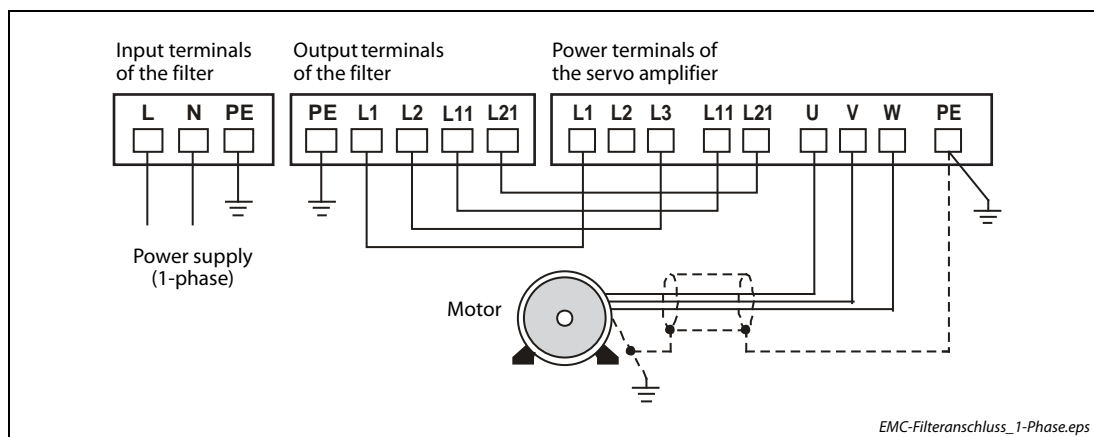

Fig. 4-32: Wiring of the EMC filter with the servo amplifier for one phase power supply

Wiring 3-phase

Fig. 4-33: Wiring of the EMC filter with the servo amplifier for three phase power supply

WARNING:

- **These filters are NOT designed for use in power networks (IT type). When the noise filters are operated leakage currents are discharged to earth. This can trigger upstream protective devices (as RCDs), particularly when there are unbalanced mains voltages, mains phase failures or switching activities on the input side of the filter.**
For further information please refer to the Mitsubishi manual for servo amplifiers and the EMC Installation Guidelines which contain detailed information about EM-compatible installation.
- **Connect the 1-phase 200 V AC to 240 V AC power supply to the terminals L1 and L3 of the servo amplifier. One of the connecting destinations is different from MR-J3 Series Servo Amplifier's. When using MR-J4 as a replacement for MR-J3, be careful not to connect the power to L2.**

5 Startup

5.1 Preparations

Before switching on the servo amplifier for the first time

Check all the following points carefully before switching on a servo amplifier for the first time:

- Has all the wiring been performed correctly? Check the power supply connections particularly carefully: Single-phase to L1 and L3, 3-phase to L1, L2 and L3.
- Double-check for damaged cables and insufficiently insulated terminals to eliminate any possibility of short circuits.
- Is the servo amplifier properly earthed? Double-check for possible earth faults and short circuits in the output circuit.
- Check that all screws, connection terminals and other cable connections are connected correctly and firmly.

Cable routing

- The wiring cables are free from excessive force.
- The encoder cable should not be used in excess of its flex life.
- The connector part of the servo motor should not be strained.

Environment

Check the following point before initial startup:

- Signal cables and power cables are not shorted by wire offcuts, metallic dust or the like.

Parameters

Check the setting of parameters by the display of the controller or setup software.

DANGER:

- *Before starting operation, check the parameters. Improper settings may cause some machines to operate unexpectedly.*
- *The servo amplifier heat sink, regenerative resistor, servo motor, etc. may be hot while power is on or for some time after power-off. Take safety measures, e.g. provide covers, to prevent accidental contact of hands and parts (cables, etc.) with them.*
- *During operation, never touch the rotor of the servo motor. Otherwise, it may cause injury.*

WARNING:

Incorrect parameter settings can damage or (in extreme cases) even destroy the connected motor. Take great care when you are setting the parameters and double check the electrical and mechanical specifications of the motor, your entire drive system and the connected machine before proceeding.

5.2 Startup of servo amplifier series MR-J4-A(-RJ)

5.2.1 Power on and off the servo amplifier

Procedure in position control mode.

Power on

Switch power on in the following procedure. Always follow this procedure at power-on.

- ① Switch off SON (Servo-on).
- ② Make sure that a command pulse train is not input.
- ③ Switch on the main circuit power supply and control circuit power supply.
When main circuit power/control circuit power is switched on, the display shows "C" (Cumulative-feedback pulses), and in 2 s later, shows data.

Power off

- ① Make sure that a command pulse train is not input.
- ② Switch off SON (Servo-on).
- ③ Switch off the main circuit power supply and control circuit power supply.

NOTES

The power on and off procedure for the operating modes speed control and torque control are not described here. For details about this please refer to the respective instruction manuals of the servo amplifier series.

In the absolute position detection system, first power-on results in AL. 25 (Absolute position erased) and the servo system cannot be switched on. The alarm can be deactivated by then switching power off once and on again.

Also, if power is switched on at the servo motor speed of 3000 1/min or higher, position mismatch may occur due to external force or the like. Power must therefore be switched on when the servo motor is at a stop.

5.2.2 Stop of operation

If any of the following situations occurs, the servo amplifier suspends the running of the servo motor and brings it to a stop. Refer to the instruction manual for the servo motor with an electromagnetic brake.

Operation/command	Stopping condition
Switch off SON (Servo-on)	The main circuit is shut off and the servo motor coasts.
Alarm occurrence	The servo motor decelerates to a stop with the command. With some alarms, however, the dynamic brake operates to bring the servo motor to a stop. (See note)
EM2 (Forced stop 2) off	The servo motor decelerates to a stop with the command. AL E6 (Servo forced stop warning) occurs. EM2 has the same function as EM1 in the torque control mode. Refer to the instruction manual for EM1.
STO (STO1, STO2) off	The main circuit is shut off and the dynamic brake operates to bring the servo motor to a stop.
LSP (Forward rotation stroke end) of LSN (Reverse rotation stroke end) off	It will bring the motor to a sudden stop and make it servo-locked. It can be run in the opposite direction.

Tab. 5-1: Stop of operation by the servo amplifier

NOTE

Refer to "MELSERVO J4 Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

5.2.3 Test operation

Before starting actual operation, perform test operation to make sure that the machine operates normally. Refer to section 5.2.1 for the power on and off methods of the servo amplifier.

<div data-bbox="416 360 754 443" style="border: 1px solid black; padding: 5px; text-align: center;">Test operation of the servo motor alone in JOG operation of test operation mode</div> <div style="text-align: center;">↓</div>	<p>In this step, confirm that the servo amplifier and servo motor operate normally.</p> <p>With the servo motor disconnected from the machine, use the test operation mode and check whether the servo motor correctly rotates at the slowest speed.</p>
<div data-bbox="416 562 754 645" style="border: 1px solid black; padding: 5px; text-align: center;">Test operation of the servo motor alone by commands</div> <div style="text-align: center;">↓</div>	<p>In this step, confirm that the servo motor correctly rotates at the slowest speed under the commands from the controller.</p> <p>Make sure that the servo motor rotates in the following procedure.</p> <ul style="list-style-type: none"> • Switch on EM2 (Forced stop 2) and SON (Servo-on). When the servo amplifier is put in a servo-on status, RD (Ready) switches on. • Switch on LSP (Forward rotation stroke end) and LSN (Reverse rotation stroke end). • When a pulse train is input from the controller, the servo motor starts rotating. Give a low speed command at first and check the rotation direction, etc. of the servo motor. If the machine does not operate in the intended direction, check the input signal.
<div data-bbox="416 949 754 1032" style="border: 1px solid black; padding: 5px; text-align: center;">Test operation with the servo motor and machine connected</div>	<p>In this step, connect the servo motor with the machine and confirm that the machine operates normally under the commands from the controller.</p> <p>Make sure that the servo motor rotates in the following procedure.</p> <ul style="list-style-type: none"> • Switch on EM2 (Forced stop 2) and SON (Servo-on). When the servo amplifier is put in a servo-on status, RD (Ready) switches on. • Switch on LSP (Forward rotation stroke end) and LSN (Reverse rotation stroke end). • When a pulse train is input from the controller, the servo motor starts rotating. Give a low speed command at first and check the operation direction, etc. of the machine. If the machine does not operate in the intended direction, check the input signal. In the status display, check for any problems of the servo motor speed, command pulse frequency, load ratio, etc. • Then, check automatic operation with the program of the controller.

Tab. 5-2: Test operation of the servo amplifier MR-J4-A at position control

5.2.4 Parameter setting

**WARNING:**

Change settings and parameters only in small steps and make afterwards at first sure whether the desired effect occurs before doing any more changes. Excessive adjustment or change of parameter setting must not be made as it will make operation instable.

In the position control mode, the servo amplifier can be used by merely changing the basic setting parameters (PA□□) mainly.

As necessary, set other parameters:

- Gain/filter setting parameters (PB□□)
- Extension setting parameters (PC□□)
- I/O setting parameters (PD□□)
- Extension setting 2 parameters (PE□□)
- Extension setting 3 parameters (PF□□)
- Linear servo motor/DD motor setting parameters (PL□□)
- Option setting parameters (Po□□) ①
- Position control parameters (PT□□) ①

① Only MR-J4-A-RJ

5.2.5 Actual operation

Start actual operation after confirmation of normal operation by test operation and completion of the corresponding parameter settings. Perform a home position return as necessary.

NOTE

If there are any problems during startup, refer to the chapter “troubleshooting” in section 8.1 and in the instruction manual of the respective servo amplifier.

5.3 Startup of servo amplifier series MR-J4-B(-RJ) and MR-J4W-B

5.3.1 Power on and off the servo amplifier

Power on

When the main and control circuit power supplies are turned on, “b01” (for the first axis) appears on the servo amplifier display.

Parameter setting

Set the parameters according to the structure and specifications of the machine. Refer to chapter 7 and the instruction manual for details.

After setting the above parameters, turn power off as necessary. Then switch power on again to enable the parameter values.

Servo-on

Enable the servo-on with the following procedure.

- ① Switch on main circuit power supply and control circuit power supply.
- ② Transmit the servo-on command with the controller.

When the servo-on status is enabled, the servo amplifier is ready to operate and the servo motor is locked.

Home position return

Always perform home position return before starting positioning operation.

NOTES

When the absolute position detection system is used in a rotary servo motor, first power-on results in AL. 25 (Absolute position erased) and the servo system cannot be switched on. The alarm can be deactivated by then switching power off once and on again.

Also, if power is switched on at the servo motor speed of 3000 1/min or higher, position mismatch may occur due to external force or the like. Power must therefore be switched on when the servo motor is at a stop.

5.3.2 Stop of operation

If any of the following situations occurs, the servo amplifier suspends the running of the servo motor and brings it to a stop.

Refer to the instruction manual for the servo motor with an electromagnetic brake.

Triggered by	Operation/command	Stopping condition
Servo system controller	Servo-off command	The main circuit is shut off and the servo motor coasts.
	Ready-off command	The base circuit is shut off and the dynamic brake operates to bring the servo motor to a stop.
	Forced stop command	The servo motor decelerates to a stop with the command. AL. E7 (Controller forced stop warning) occurs.
Servo amplifier	Alarm occurrence	The servo motor decelerates to a stop with the command. With some alarms, however, the dynamic brake operates to bring the servo motor to a stop. (See note)
	EM2 (Forced stop 2) off	The servo motor decelerates to a stop with the command. AL. E6 (Servo forced stop warning) occurs. EM2 has the same function as EM1 in the torque control mode. Refer to the instruction manual for EM1.
	STO (STO1, STO2) off	The main circuit is shut off and the dynamic brake operates to bring the servo motor to a stop.

Tab. 5-3: Stop of operation by servo system controller or servo amplifier

NOTE

Refer to “MELSERVO J4 Servo Amplifier Instruction Manual (Troubleshooting)” for details of alarms and warnings.

5.3.3 Test operation

Before starting actual operation, perform test operation to make sure that the machine operates normally. Refer to section 5.3.1 for the power on and off methods of the servo amplifier.

NOTE

If necessary, verify controller program by using motor-less operation. Refer to section 6.2.5 for the motor-less operation

<div>Test operation of the servo motor alone in JOG operation of test operation mode</div>	<p>In this step, confirm that the servo amplifier and servo motor operate normally.</p> <p>With the servo motor disconnected from the machine, use the test operation mode and check whether the servo motor correctly rotates at the slowest speed.</p>
<div>Test operation of the servo motor alone by commands</div>	<p>In this step, confirm that the servo motor correctly rotates at the slowest speed under the commands from the controller.</p> <p>Give a low speed command at first and check the rotation direction, etc. of the servo motor. If the machine does not operate in the intended direction, check the input signal.</p>
<div>Test operation with the servo motor and machine connected</div>	<p>In this step, connect the servo motor with the machine and confirm that the machine operates normally under the commands from the controller.</p> <p>Give a low speed command at first and check the operation direction, etc. of the machine. If the machine does not operate in the intended direction, check the input signal.</p> <p>Check any problems with the servo motor speed, load ratio, and other status display items with MR Configurator2.</p> <p>Then, check automatic operation with the program of the controller.</p>

Tab. 5-4: Test operation of the servo amplifier MR-J4-B

NOTE

If there are any problems during startup, refer to the chapter “troubleshooting” in section 8.2, 8.3 and in the instruction manual of the respective servo amplifier.

6 Operation and Settings

6.1 Display and operation section of MR-J4-A series

The MR-J4-□A(-RJ) servo amplifier has the display section (5-digit, 7-segment LED) and operation section (4 push buttons) for servo amplifier status display, alarm display, parameter setting, etc. Also, press the "MODE" and "SET" buttons at the same time for 3 s or more to switch to the one-touch tuning mode.

6.1.1 Overview

The operation section and display data are described below.

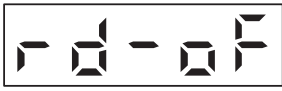

Fig. 6-1: Display and push buttons of MR-J4-A

6.1.2 Display flowchart MR-J4-A

Press the "MODE" button once to shift to the next display mode. Refer to section 6.1.3 and later for the description of the corresponding display mode.

To refer to and set the gain/filter parameters, extension setting parameters and I/O setting parameters, enable them with parameter PA19 (Parameter writing inhibit).

Display mode transition	Initial screen	Function	Refer to
Status display		Servo status display.  appears at power-on. ①	Section 6.1.3

The servo status during operation is shown on the 5-digit, 7-segment LED display. Press the “UP” or “DOWN” button to change display data as desired. When the required data is selected, the corresponding symbol is displayed. Press the “SET” button to display that data. At only power-on, however, data appears after the symbol of the status display selected in Parameter PC36 has been shown for 2 s.

Display transition

After selecting the status display mode with the "MODE" button, pressing the "UP" or "DOWN" button changes the display as shown below.

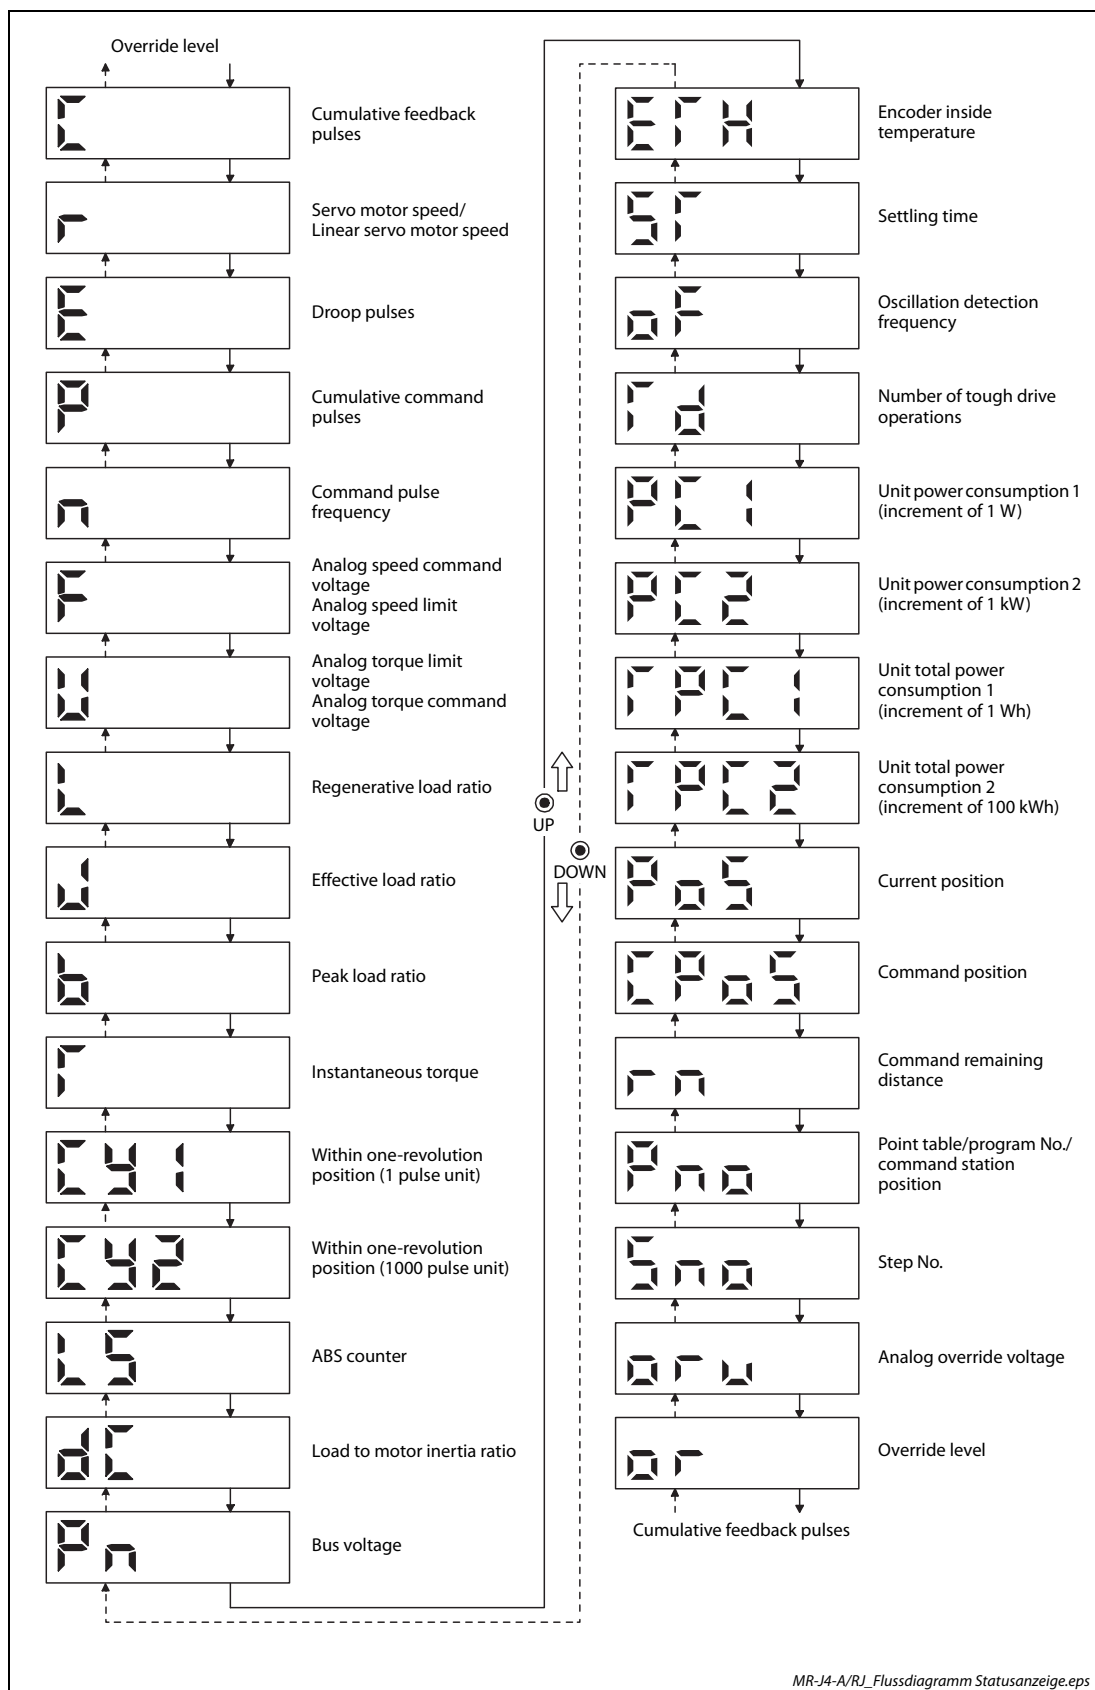

Fig. 6-5: MR-J4-A-RJ – Display transition of status display (Positioning mode/DD motor control mode)

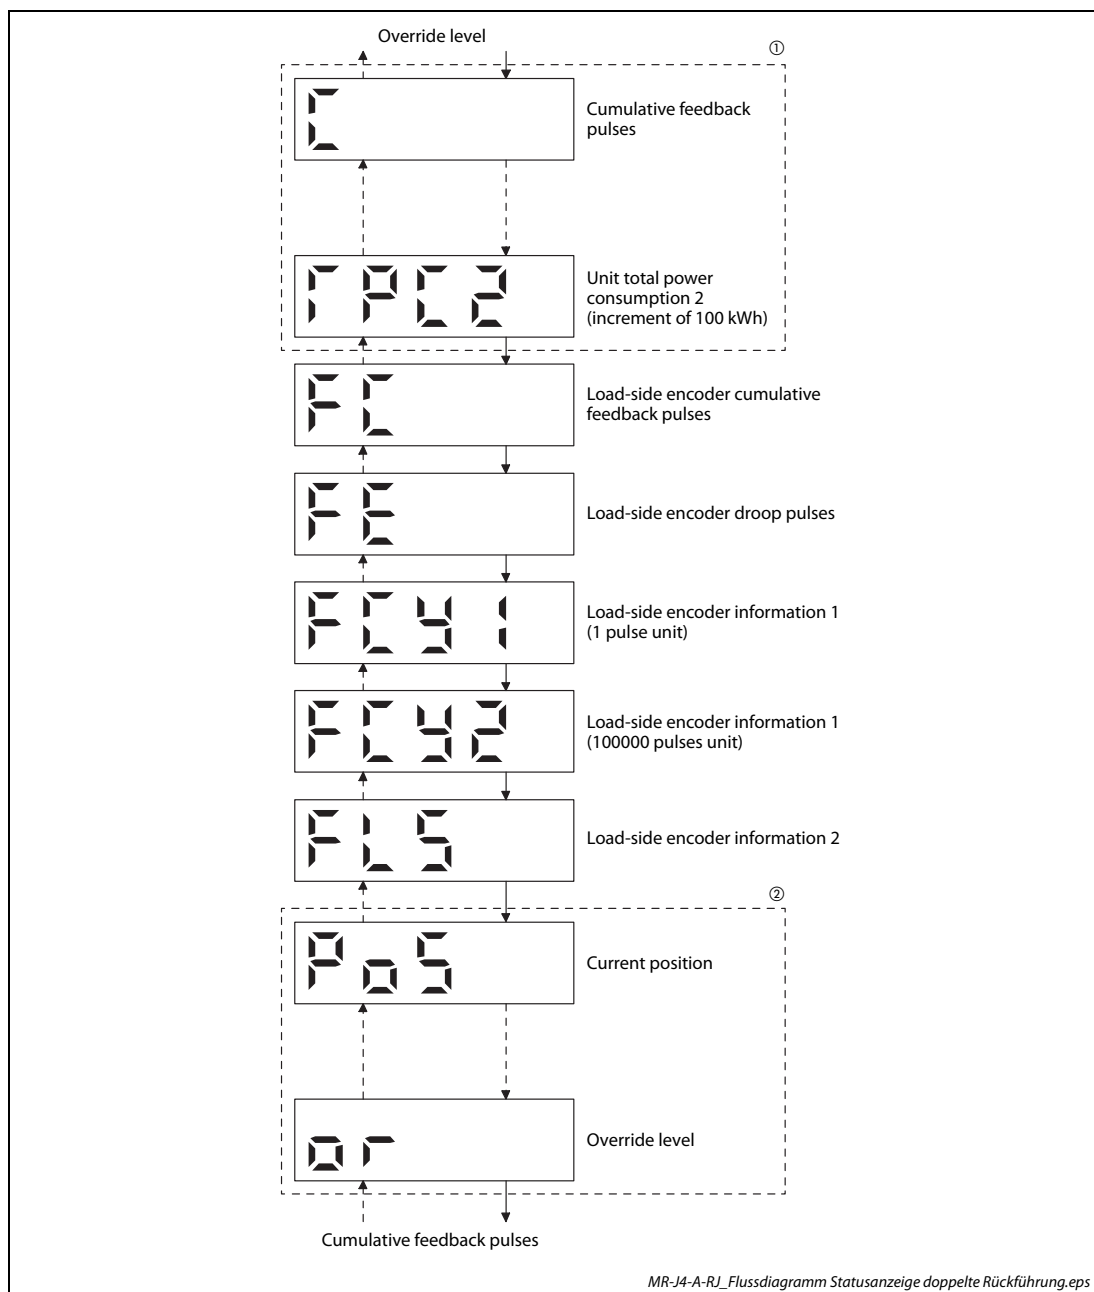

Fig. 6-6: MR-J4-A-RJ – Display transition of status display (fully closed loop control mode)

- ① The displays in the frames are from the cumulative feedback pulses of positioning mode to unit total power consumption 2 (increment of 100 kWh) with some displays omitted.
- ② The displays in the frames are from the current position of positioning mode to override level with some displays omitted.

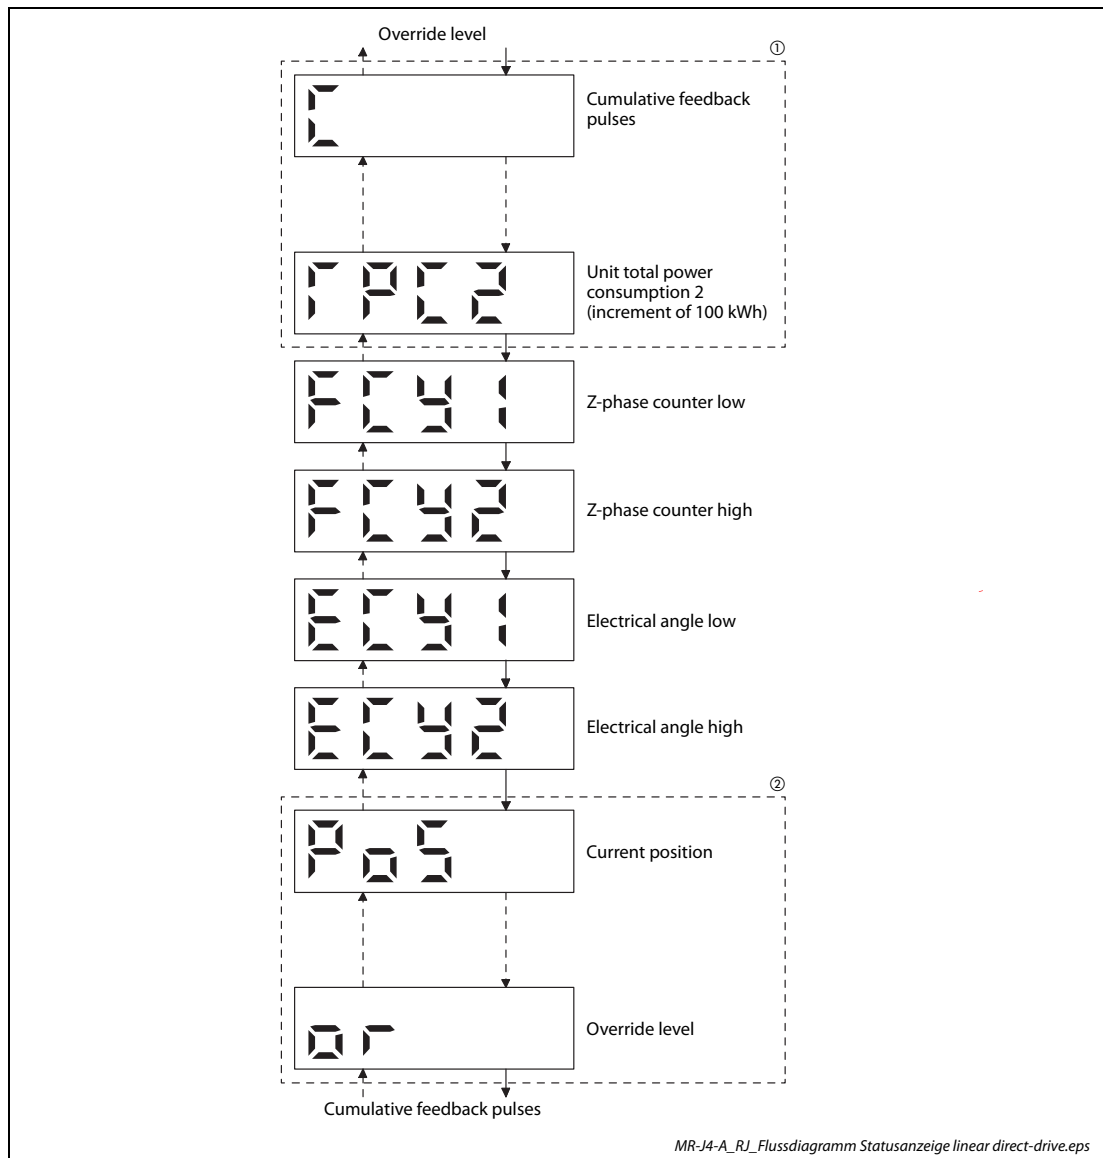

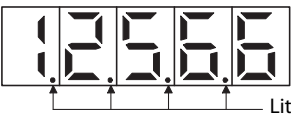

Fig. 6-7: MR-J4-A-RJ – Display transition of status display (Linear servo motor control mode)

- ① The displays in the frames are from the cumulative feedback pulses of positioning mode to unit total power consumption 2 (increment of 100 kWh) with some displays omitted.
- ② The displays in the frames are from the current position of positioning mode to override level with some displays omitted.

6.1.6 Display examples

Item	State	Displayed data
		Servo amplifier display
Servo motor speed	Forward rotation at 2500 min ⁻¹	
	Reverse rotation at 3000 min ⁻¹	 Reverse rotation is indicated by “-”.
Load to motor inertia ratio	7.00 times	
ABS counter	11252 revolutions	
	-12566 revolutions	

Tab. 6-3: Display examples of status display MR-J4-A(-RJ)

6.1.7 Changing the status display screen

The status display item of the servo amplifier display shown at power-on can be changed by changing Parameter PC36 settings. The item displayed in the initial status changes with the control mode as follows.

Control mode	Status display
Position	Cumulative feedback pulses
Position/speed	Cumulative feedback pulses/servo motor speed
Speed	Servo motor speed
Speed/torque	Servo motor speed/analog torque command voltage
Torque	Analog torque command voltage
Torque/position	Analog torque command voltage/cumulative feedback pulses
Positioning (point table method/program method) ①	Current position
Positioning (indexer method) ①	Cumulative feedback pulses

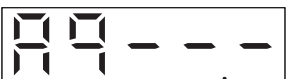

Tab. 6-4: Display of initial status MR-J4-A(-RJ)

① Only MR-J4-A-RJ

6.1.8

Alarm mode

The current alarm, past alarm history and parameter error are displayed. The lower 2 digits on the display indicate the alarm number that has occurred or the parameter number in error.

Name	Display ^①	Description
Current alarm		Indicates no occurrence of an alarm.
		Indicates the occurrence of AL. 33.1 (Main circuit voltage error). Flickers at alarm occurrence.
Alarm history		Indicates that the last alarm is AL. 50.1 (Thermal overload error 1 during operation).
		Indicates the second last alarm is AL. 33.1 (Main circuit voltage error).
		Indicates the third last alarm is AL. 10.1 (Voltage drop in the control circuit power).
		
		Indicates that there is no tenth alarm in the past.
		Indicates that there is no eleventh alarm in the past.
		Indicates that there is no twelfth alarm in the past.
		
Parameter error No. ^②		This indicates no occurrence of AL. 37 (Parameter error).
		The data content error of Parameter PA12 (Reverse rotation torque limit).
Point table error No. ^③		<p>The value of the point table is over the setting range. The error point table No. (intermediate digit "2") and item (lower digit "d") are displayed.</p> <p>The following shows the items. P: position data, d: motor speed, A: acceleration time constant, b: deceleration time constant, n: dwell, H: sub function, M: M code</p>

Tab. 6-5: Alarm examples

- ① If a parameter error and point table error occur simultaneously, the display shows the parameter error (only MR-J4-A-RJ).
- ② The display shows only when the current alarm is AL. 37 (Parameter error).
- ③ Only MR-J4-A-RJ

NOTES

Any mode screen displays the current alarm.

Even during alarm occurrence, the other screen can be viewed by pressing the button in the operation area. At this time, the decimal point in the fourth digit remains flickering.

For any alarm, remove its cause and clear it in any of the following methods.

- Switch power off, then on.
- Push the “SET” button on the current alarm screen.
- Turn on RES (Reset).

Use Parameter PC18 to clear the alarm history.

Push “UP” or “DOWN” to move to the next history.

6.1.9 Parameter mode

Parameter mode transition

After selecting the corresponding parameter mode with the “MODE” button, pushing the “UP” or “DOWN” button changes the display as shown below.

Fig. 6-8: MR-J4-A – Parameter display selection

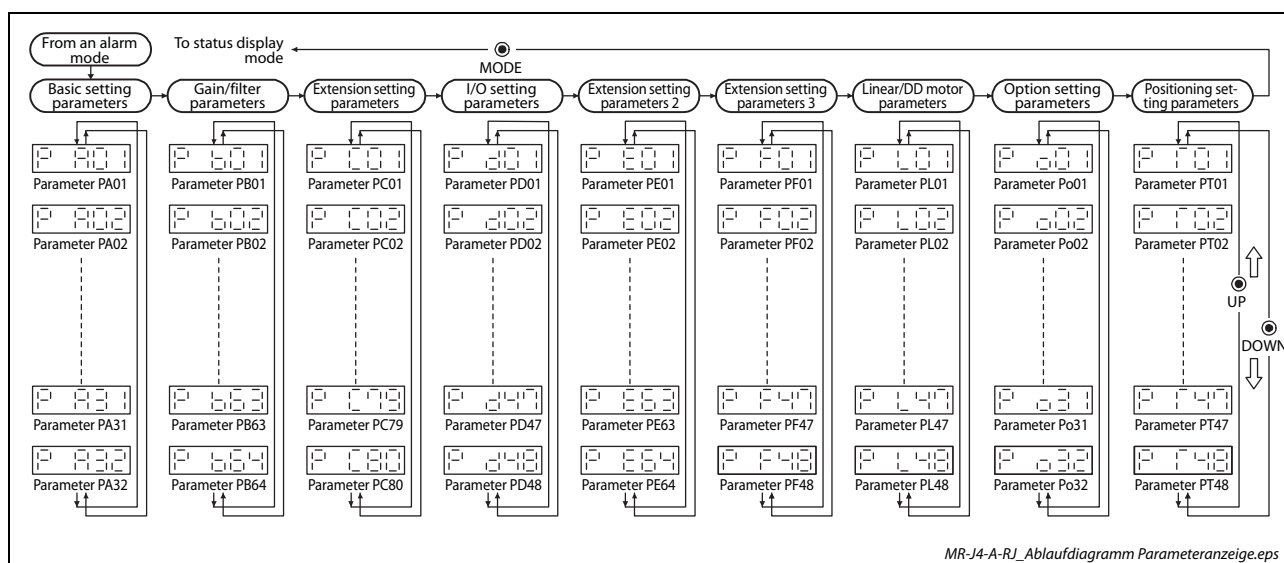

Fig. 6-9: MR-J4-A-RJ – Parameter display selection

Operation example

- Parameters of 5 or less digits

The following example shows the operation procedure performed after power-on to change the control mode to the speed control mode with Parameter PA01 (Operation mode). Press “MODE” to switch to the basic setting parameter screen.

Fig. 6-10: Changing PA01 from "Position control mode" to "Speed control mode"

To shift to the next parameter, press the "UP" or "DOWN" button.

When changing the Parameter PA01 setting, change its set value, then switch power off once and switch it on again to enable the new value.

● Parameters of 6 or more digits

The following example gives the operation procedure to change the electronic gear numerator to "123456" with Parameter PA06 (Electronic gear numerator).

Fig. 6-11: Changing the setting of PA06 to "123456"

6.1.10 Test operation mode

WARNING:

- *The test operation mode is designed for checking servo operation. Do not use it for actual operation.*
- *If the servo motor operates unexpectedly, use EM2 (Forced stop 2) to stop it.*

NOTES

The test operation mode cannot be used in the absolute position detection system by DIO.

MR Configurator2 is required to perform positioning operation.

Test operation cannot be performed if SON (Servo-on) is not turned off.

Mode switching

Call the display screen shown after power-on. Select JOG operation or motor-less operation in the following procedure. Using the "MODE" button, show the diagnostic screen.

Fig. 6-12: Mode switching for JOG operation or motor-less operation

JOG operation**NOTE**

When performing JOG operation, turn on EM2, LSP and LSN. LSP and LSN can be set to automatic on by setting Parameter PD01 to "□ C □□".

JOG operation can be performed when there is no command from the controller.

- Operation

The servo motor rotates while holding down the "UP" or the "DOWN" button. The servo motor stops rotating by releasing the button. The operation condition can be changed using MR Configurator2. The initial operation condition and setting range for operation are listed below.

Item	Initial setting	Setting range
Speed [1/min]	200	0 to instantaneous permissible speed
Acceleration/deceleration time constant [ms]	1000	0 to 50000

Tab. 6-6: Initial settings for operation

The following table shows how to use the buttons.

Button	Description
"UP"	Press to start CCW rotation. Release to stop.
"DOWN"	Press to start CW rotation. Release to stop.

Tab. 6-7: Use of the buttons

If the USB cable is disconnected during JOG operation using the MR Configurator2, the servo motor decelerates to a stop.

- Status display

Press the "MODE" button in the JOG operation-ready status to call the status display screen. When the JOG operation is performed using the "UP" or "DOWN" button, the servo status is displayed during the JOG operation. Every time the "MODE" button is pushed, the next status display screen appears. When one cycle of the screen display is complete, it returns to the jog operation-ready status screen. Refer to section 6.1.3 for details of status display. Note that the status display screen cannot be changed by the "UP" or "DOWN" button during the JOG operation.

- Termination of JOG operation

To end the JOG operation, shut the power off once, or press the "MODE" button to switch to the next screen, and then hold down the "SET" button for 2 s or longer.

Positioning operation

NOTES

MR Configurator2 is required to perform positioning operation.

Turn on EM2 (forced stop 2) when performing positioning operation.

For positioning operation of the servo amplifier MR-J4-A-RJ in positioning mode with the point table method, program method, indexer method refer to the instruction manual.

Positioning operation can be performed when there is no command from a controller.

● Operation

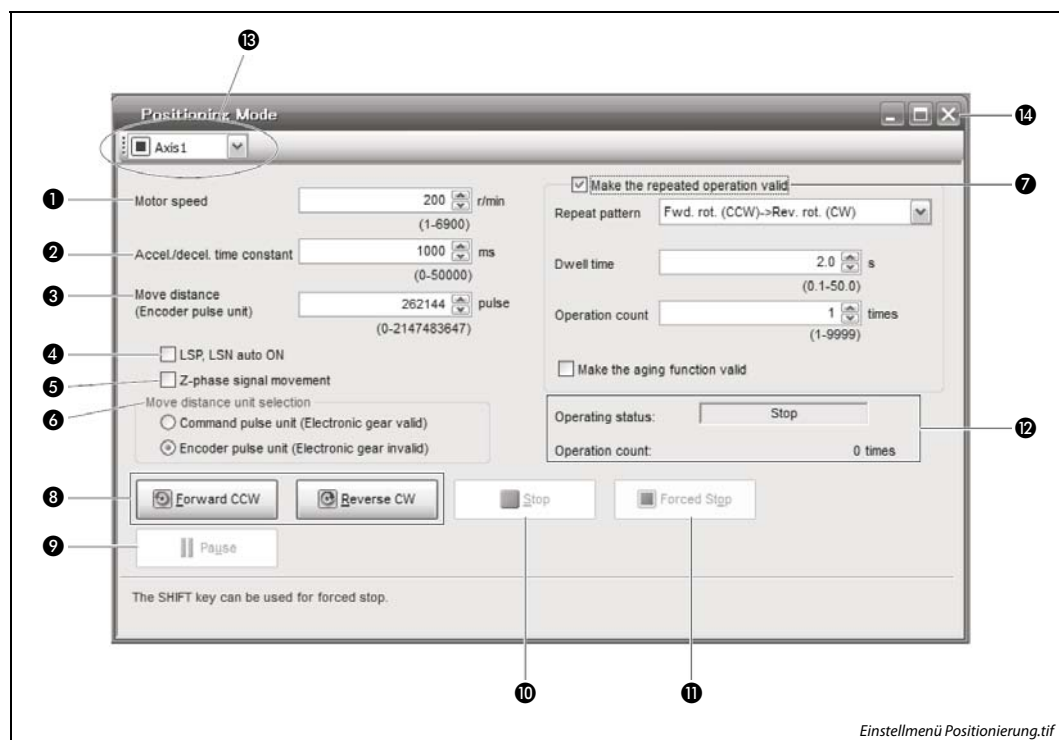

Fig. 6-13: Setting menu of setup software for positioning

- 1** Motor speed [1/min]
Enter the servo motor speed into the “Motor speed” input field.
- 2** Acceleration/deceleration time constant [ms]
Enter the acceleration/deceleration time constant into the “Accel./decel time” input field.
- 3** Travel distance [pulse]
Enter the travel distance into the “Travel distance” input field.
- 4** LSP/LSN are automatically turned on
When setting the external stroke signal to automatic on, click the check box to enable it. When it is not selected, turn on LSP and LSN externally.
- 5** Move till Z-phase signal
Travel is made until the travel distance is reached and the first Z-phase signal in the travelling direction turns on.
- 6** Travel distance unit selection
Select with the option buttons whether the travel distance set in **3** is in the command pulse unit or in the encoder pulse unit.
When the command input pulse unit is selected, the value, which is the set travel distance multiplied by the electronic gear, will be the command value. When the encoder pulse unit is selected, the travel distance is not multiplied by the electronic gear.

7 Enable repeat operation

To perform repeat operation, click the check. The initial setting and setting range for the repeat operation are listed in the following table.

Item	Initial setting	Setting range
Repeat pattern	Fwd. rot. (CCW) to rev. rot. (CW)	Fwd. rot. (CCW) to rev. rot. (CW) Fwd. rot. (CCW) to fwd. rot. (CCW) Rev. rot. (CW) to fwd. rot. (CCW) Rev. rot. (CW) to rev. rot. (CW)
Dwell time [s]	2.0	0.1 to 50.0
Number of operations [times]	1	1 to 9999

Tab. 6-8:Initial settings for repeat operation

To perform continuous operation with the repeat pattern and dwell time settings, which are set by referring to the above table, click the check box of "Make the aging function enabled".

8 Forward/reverse the servo motor

Click the "Forward" button to rotate the servo motor in the forward rotation direction.
Click the "Reverse" button to rotate the servo motor in the reverse rotation direction.

9 Pause the servo motor

Click the "Pause" button during servo motor rotation to temporarily stop the servo motor. This button is enabled during servo motor rotation.

10 Stop the servo motor

Click the "Stop" button during servo motor rotation to stop the servo motor.

11 Forced stop

Click the "Forced stop" button during servo motor rotation to make a sudden stop. This button is enabled during servo motor rotation.

12 Operation status

The operation status during the repeat operation, and the number of operations are displayed.

13 Axis No.

Axis No. in operation is displayed.

14 Termination of positioning operation window

Click the close button to cancel the positioning operation mode and close the window.

● Status display

The status display can be monitored during positioning operation.

Motor-less operation

Without connecting the servo motor, output signals or status display can be provided in response to the input device as if the servo motor is actually running. This operation can be used to check the sequence of a controller or the like.

- Start of motor-less operation
After setting “□□□1” in Parameter PC60, cycle the power. After that, perform external operation as in ordinary operation.
- Termination of motor-less operation
To terminate the motor-less operation, set Parameter PC60 to “□□□0” and then turn the power off.

Program operation

Positioning operation can be performed in two or more operation patterns combined, without using a controller. Use this operation with the forced stop reset. This operation may be used independently of whether servo-on or servo-off and whether a controller is connected or not.

Exercise control on the program operation screen of MR Configurator2. For full information, refer to the MR Configurator2 Installation Guide

Operation	Screen control
Start	Click the “Operation start” button.
Stop	Click the “Stop” button.
Forced stop	Click the “Forced stop” button.

Tab. 6-9: Buttons for program operation

Output signal (DO) forced output

Output signals can be switched on/off forcibly independently of the servo status. This function is used for output signal wiring check, etc. Exercise control on the DO forced output screen of MR Configurator2.

6.2 Display and operation section of MR-J4-B(-RJ) series

On the servo amplifier display (three-digit, seven-segment LED), check the status of communication with the servo system controller at power-on, and the axis number, and diagnose a malfunction at occurrence of an alarm.

Switching to the test operation mode, deactivating control axes, and setting control axis No. are enabled with switches on the servo amplifier.

6.2.1 Overview

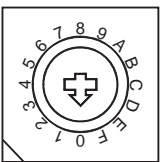

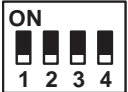

Fig. 6-14: Display and controls of MR-J4-B(-RJ)

No.	Name	Description	Refer to
①	Display	The 3-digit, seven-segment LED shows the servo status and alarm number	section 6.2.2 section 6.2.3
②	 SW1: Rotary axis setting switch	Used to set the axis number of the servo amplifier. (Axis No. 1–16)	page 4-26
③	 SW2: Control axis setting switch	SW2-1 is used to perform the test operation mode. SW2-2 is used for disabling the control axis. SW2-3 and 2-4 are auxiliary switches for setting the axis No. 17–64	page 6-27 page 4-26

Tab. 6-10: Controls and function

Disabling control axis switch (SW2-2)

Turning “ON (up)” the disabling control axis switch disables the corresponding servo motor. The servo motor will be disabled-axis status and will not be recognized by the controller.

Fig. 6-15: SW2-2 is switched ON

MR-J4-B DIP 0100.eps

6.2.2 Scrolling display

Normal display

When there is no alarm, the axis No. and blank are displayed in rotation.

Fig. 6-16: Alternating display in normal operation

Alarm display

When an alarm occurs, the alarm number (two digits) and the alarm detail (one digit) are displayed following the status display. For example, the following shows when AL. 32 (Overcurrent) is occurring.

Fig. 6-17: Alternating display when alarm occurs

6.2.4 Test operation

WARNING:

- **The test operation mode is designed for checking servo operation. It is not for checking machine operation. Do not use this mode with the machine. Always use the servo motor alone.**
- **If the servo motor operates abnormally, use EM2 (Forced stop 2) to stop it.**

By using a personal computer and MR Configurator2, you can execute jog operation, positioning operation, DO forced output program operation without connecting the servo system controller.

NOTES

The content described in this section indicates that the servo amplifier and a personal computer are directly connected.

For full information, refer to the MR Configurator2 Installation Guide.

Test operation mode in MR Configurator2

NOTE

When the test operation mode is selected with the test operation select switch (SW2-1), the SSCNET III/H communication for the servo amplifier in the test operation mode and the following servo amplifiers is blocked.

- JOG operation

JOG operation can be performed without using the servo system controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the servo system controller is connected or not.

Exercise control on the jog operation screen of MR Configurator2.

Item	Initial setting	Setting range
Speed [1/min]	200	0 to max. speed
Acceleration/deceleration time constant [ms]	1000	0 to 50000

Operation method for positioning operation

● Program operation

Positioning operation can be performed in two or more operation patterns combined, without using the servo system controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the servo system controller is connected or not.

Exercise control on the program operation screen of MR Configurator2.

Operation	Screen control
Start	Click the "Start" button.
Pause	Click the "Pause" button.
Stop	Click the "Stop" button.
Forced stop	Click the "Forced stop" button.

Tab. 6-16:

Operation method for program operation

● Output signal (DO) forced output

Output signals can be switched on/off forcibly independently of the servo status. Use this function for output signal wiring check, etc. Exercise control on the DO forced output screen of MR Configurator2.

Operation procedure

- ① Turn off the power.
- ② Turn "ON (up)" SW2-1.

Fig. 6-19: Setting of SW2-1 for test operation

Turning "ON (up)" SW2-1 during power-on will not start the test operation mode.

- ③ Turn on the servo amplifier.

When initialization is completed, the decimal point on the first digit will flicker.

When an alarm or warning also occurs during the test operation, the decimal point on the first digit will flicker as follows.

- ④ Start operation with the personal computer.

6.2.5 Motor-less operation in controller

NOTES

Use motor-less operation which is available by making the servo system controller parameter setting.

Connect the servo system controller to the servo amplifier before the motor-less operation.

The motor-less operation using a controller is available with rotary servo motors only. It will be available with linear servo motors and direct drive motors in the future.

Motor-less operation

Without connecting the servo motor to the servo amplifier, output signals or status displays can be provided in response to the servo system controller commands as if the servo motor is actually running. This operation may be used to check the servo system controller sequence. Use this operation with the forced stop reset. Use this operation with the servo amplifier connected to the servo system controller.

To stop the motor-less operation, set the motor-less operation selection to "Disable" in the servo parameter setting of the servo system controller. When the power supply is turned on next time, motorless operation will be disabled.

Load item	Condition
Load torque	0
Load to motor inertia ratio	Same as the moment of inertia of the servo motor

Tab. 6-17:

Load conditions for motor-less operation

The following alarms and warning do not occur. However, the other alarms and warnings occur as when the servo motor is connected.

Alarm and warning	Rotary servo motor	Linear servo motor	Direct drive servo motor	Rotary servo motor in fully closed loop system ^①
AL. 16 (Encoder initial communication error 1)	✓	✓	✓	✓

AL. 71 (Load-side encoder error 2)	—	—	—	✓

Tab. 6-18: *Alarms and warnings during motor-less operation*

^① The fully closed loop system is available for the MR-J4-□B□(-RJ) servo amplifiers of which software version is A3 or above. Check the software version using MR Configurator2.

Operation procedure

- ① Set the servo amplifier to the servo-off status.
- ② Set Parameter PC05 to "□□□1", turn "OFF (down: normal condition side)" the test operation mode switch (SW2-1), and then turn on the power supply.

Fig. 6-20: Setting of SW2-1 for motor-less operation

- ③ Start the motor-less operation with the servo system controller.
The display shows the following screen.

6.3 Display and operation section of MR-J4W-B series

On the servo amplifier display (three-digit, seven-segment LED), check the status of communication with the servo system controller at power-on, and the axis number, and diagnose a malfunction at occurrence of an alarm.

Switching to the test operation mode, deactivating control axes, and setting control axis No. are enabled with switches on the servo amplifier.

6.3.1 Overview

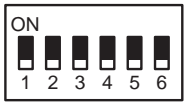

Fig. 6-21: Display and controls of MR-J4-B

No.	Name	Description	Refer to
①	Display	The 3-digit, seven-segment LED shows the servo status and alarm number	section 6.2.2 section 6.2.3
②	 SW1: Rotary axis setting switch	Used to set the axis number of the servo amplifier. (Axis No. 1–16)	page 4-27
③	USB connector (CN5)	Connect with PC for communication	section 4.4.2
③	SW2: Control axis setting switch 	SW2-1 is used to perform the test operation mode. SW2-2, 2-3, 2-4 ① are used for disabling the control axes A/B/C ①. SW2-5 and 2-6 are auxiliary switches for setting the axis No. 17–64	page 6-35 page 4-27

Tab. 6-19: Controls and function

① SW2-4 is only for the 3-axes model MR-J4W3-B to disable axis C. With the 2-axes model MR-J4W2-B SW2-4 is for manufacturer setting.

Disabling control axis switches (SW2-2, SW2-3, and SW2-4)

For disabling the control axes refer to section 4.7.

6.3.2 Scrolling display

Displaying the status of each axis in rotation enables you to check the status of all axes.

Normal display

When there is no alarm, the status of all axes are displayed in rotation.

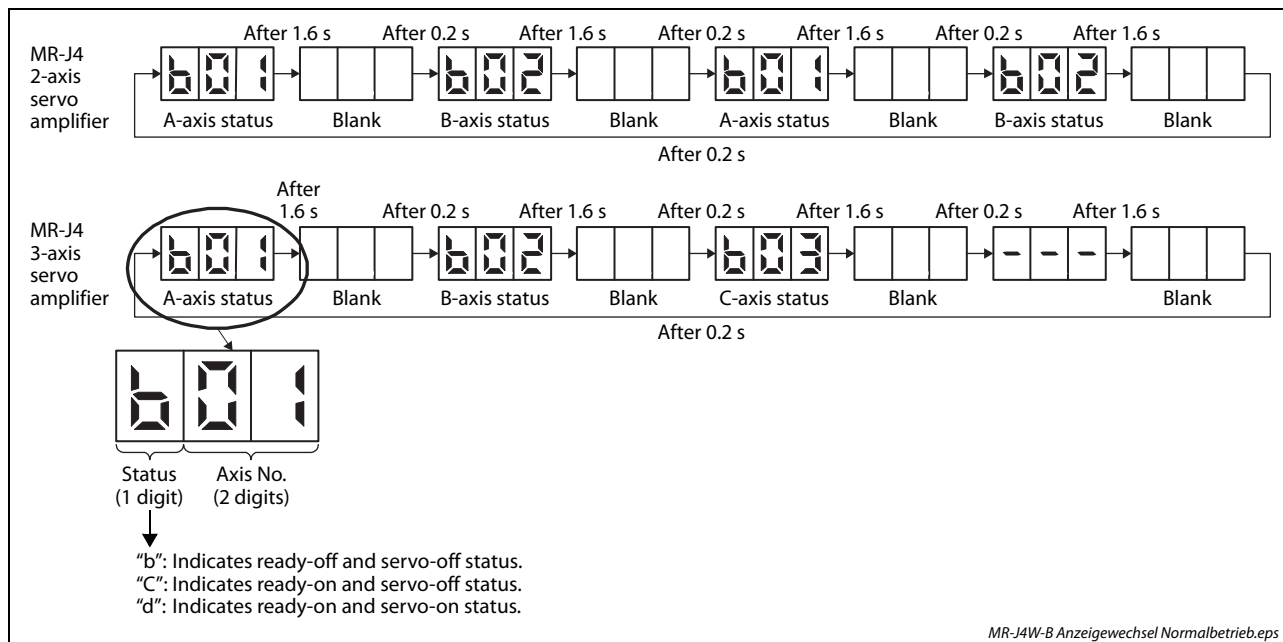

Fig. 6-22: Alternating display in normal operation

Alarm display

When an alarm occurs, the alarm number (two digits) and the alarm detail (one digit) are displayed following the status display. For example, the following shows when AL. 16 (Encoder initial communication error 1) is occurring at the A-axis, and AL. 32 (Overcurrent) is occurring at the B-axis simultaneously.

Fig. 6-23: Alternating display when alarm occurs

6.3.4 Test operation

WARNING:

- **The test operation mode is designed for checking servo operation. It is not for checking machine operation. Do not use this mode with the machine. Always use the servo motor alone.**
- **If the servo motor operates abnormally, use EM2 (Forced stop 2) to stop it.**

By using a personal computer and MR Configurator2, you can execute jog operation, positioning operation, DO forced output program operation without connecting the servo system controller.

NOTES

The content described in this section indicates that the servo amplifier and a personal computer are directly connected.

For full information, refer to the MR Configurator2 Installation Guide.

Test operation mode in MR Configurator2
NOTES

All axes will be in the test operation mode for the multi-axis servo amplifier. Although only one axis is active in the mode.

When the test operation mode is selected with the test operation select switch (SW2-1), the SSCNET III/H communication for the servo amplifier in the test operation mode and the following servo amplifiers is blocked.

- JOG operation

JOG operation can be performed without using the servo system controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the servo system controller is connected or not.

Exercise control on the jog operation screen of MR Configurator2.

Item	Initial setting	Setting range
Speed [1/min]	200	0 to max. speed

● Program operation

Positioning operation can be performed in two or more operation patterns combined, without using the servo system controller. Use this operation with the forced stop reset. This operation may be used independently of whether the servo is on or off and whether the servo system controller is connected or not.

Exercise control on the program operation screen of MR Configurator2.

Operation	Screen control
Start	Click the "Start" button.
Pause	Click the "Pause" button.
Stop	Click the "Stop" button.
Forced stop	Click the "Forced stop" button.

Tab. 6-25:

Operation method for positioning operation

● Output signal (DO) forced output

Output signals can be switched on/off forcibly independently of the servo status. Use this function for output signal wiring check, etc. Exercise control on the DO forced output screen of MR Configurator2.

Operation procedure

- ① Turn off the power.
- ② Turn "ON (up)" SW2-1.

Fig. 6-25: Setting of SW2-1 for test operation

Turning "ON (up)" SW2-1 during power-on will not start the test operation mode.

- ③ Turn on the servo amplifier.

When initialization is completed, the decimal point on the first digit will flicker.

When an alarm or warning also occurs during the test operation, the decimal point on the first digit will flicker as follows.

- ④ Start operation with the personal computer.

6.3.5 Motor-less operation in controller

NOTES

Use motor-less operation which is available by making the servo system controller parameter setting

Connect the servo system controller to the servo amplifier before the motor-less operation.

The motor-less operation using a controller is available with rotary servo motors only. It will be available with linear servo motors and direct drive motors in the future.

Motor-less operation

Without connecting the servo motor to the servo amplifier, output signals or status displays can be provided in response to the servo system controller commands as if the servo motor is actually running. This operation may be used to check the servo system controller sequence. Use this operation with the forced stop reset. Use this operation with the servo amplifier connected to the servo system controller.

To stop the motor-less operation, set the motor-less operation selection to "Disable" in the servo parameter setting of the servo system controller. When the power supply is turned on next time, motorless operation will be disabled.

Load item	Condition
Load torque	0
Load to motor inertia ratio	Same as the moment of inertia of the servo motor

Tab. 6-26:

Load conditions for motor-less operation

The following alarms and warning do not occur. However, the other alarms and warnings occur as when the servo motor is connected.

Alarm and warning	Rotary servo motor	Linear servo motor	Direct drive servo motor	Rotary servo motor in fully closed loop system ^①
AL. 16 (Encoder initial communication error 1)	✓	✓	✓	✓
AL. 1E (Encoder initial communication error 2)	✓	✓	✓	✓
AL. 1F (Encoder initial communication error 3)	✓	✓	✓	✓
AL. 20 (Encoder normal communication error 1)	✓	✓	✓	✓
AL. 21 (Encoder normal communication error 2)	✓	✓	✓	✓

AL. 71 (Load-side encoder error 2)	—	—	—	✓

Tab. 6-27: *Alarms and warnings during motor-less operation*

^① The fully closed loop system is available for the MR-J4W2-□B servo amplifiers of which software version is A3 or above. Check the software version using MR Configurator2.

Operation procedure

- ① Set the servo amplifier to the servo-off status.
- ② Set parameter PC05 to "□□□1", turn "OFF (down: normal condition side)" the test operation mode switch (SW2-1), and then turn on the power supply.

Fig. 6-26: Setting of SW2-1 for motor-less operation

- ③ Start the motor-less operation with the servo system controller.

The display shows the following screen.

7 Parameters

**WARNING:**

- *Never make a drastic adjustment or change to the parameter values as doing so will make the operation unstable.*
- *If fixed values are written in the digits of a parameter, do not change these values.*
- *Do not change parameters for manufacturer setting.*
- *Do not set a value other than the described values to each parameter.*

7.1 MR-J4-A

7.1.1 Basic setting parameters

NOTES

To enable a parameter whose symbol is preceded by *, cycle the power after setting it.

Abbreviations of operation modes indicate the followings.

- Standard: Standard (semi closed loop system) use of the rotary servo motor
- Full.: Fully closed loop system use of the rotary servo motor
- Lin.: Linear servo motor use
- DD: Direct drive (DD) motor use

The symbols in the control mode column mean as follows.

- P: Position control mode
- S: Speed control mode
- T: Torque control mode

PA10	INP	100	pulse	0–65535	P																																																																																												
In-position range Set an in-position range per command pulse. To change it to the servo motor encoder pulse unit, set parameter PC24.																																																																																																	
PA11	TLP	100.0	%	0.0–100.0	P S T																																																																																												
Forward rotation torque limit/positive direction thrust limit You can limit the torque or thrust generated by the servo motor. Set the parameter referring to the instruction manual. When you output torque or thrust as analog monitor output, the larger value of parameter PA11 (Forward rotation torque limit/positive direction thrust limit value) or PA12 (Reverse rotation torque limit/negative direction thrust limit value) will be the maximum output voltage (8 V). Set the parameter on the assumption that the maximum torque or thrust is 100.0 [%]. The parameter is for limiting the torque of the servo motor in the CCW power running or CW regeneration, or limiting the thrust of the linear servo motor in the positive direction power running or negative direction regeneration. Set this parameter to "0.0" to generate no torque or thrust.																																																																																																	
PA12	TLN	100.0	%	0.0–100.0	P S T																																																																																												
Reverse rotation torque limit/negative direction thrust limit You can limit the torque or thrust generated by the servo motor. When you output torque or thrust with analog monitor output, the larger value of parameter PA11 (Forward rotation torque limit/positive direction thrust limit value) or PA12 (Reverse rotation torque limit/negative direction thrust limit value) will be the maximum output voltage (8 V). Set the parameter on the assumption that the maximum torque or thrust is 100.0 [%]. The parameter is for limiting the torque of the servo motor in the CCW power running or CW regeneration, or limiting the thrust of the linear servo motor in the positive direction power running or negative direction regeneration. Set this parameter to "0.0" to generate no torque or thrust.																																																																																																	

Tab. 7-2: Detailed overview of parameters PA for MR-J4-A (5)

Number	Symbol	Initial value	Unit	Setting range	Control mode
PA13	*PLSS	0100H		Refer to text	P

Command pulse input form

0

Command input pulse train form selection

0: Forward/reverse rotation pulse train

1: Signed pulse train

2: A-phase/B-phase pulse train (The servo amplifier imports input pulses after multiplying by four.)

Refer to the following table for settings.

Pulse train logic selection

0: Positive logic

1: Negative logic

Refer to the following table for settings.

Command input pulse train filter selection

Selecting proper filter enables to enhance noise immunity.

0: Command input pulse train is 4 Mpulses/s or less.

1: Command input pulse train is 1 Mpulse/s or less.

2: Command input pulse train is 500 kpulses/s or less.

3: Command input pulse train is 200 kpulses/s or less (available for the software version A5 or later)

1 Mpulse/s or lower commands are supported by "1". When inputting commands over 1 Mpulse/s and 4 Mpulses/s or lower, set "0".

Incorrect setting may cause the following malfunctions.

- Setting a value higher than actual command will lower noise immunity.
- Setting a value lower than actual command will cause a position mismatch.

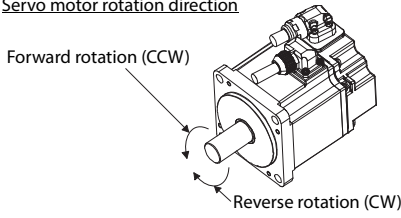

For manufacturer setting

0: Manufacturer setting

Setting value	Pulse train form	Forward rotation (positive direction) command	Reverse rotation (negative direction) command
□□10H	Negative logic	Forward rotation pulse train (positive direction pulse train)	Reverse rotation pulse train (negative direction pulse train)
□□11H		Pulse train + sign	
□□12H		A-phase pulse train B-phase pulse train	
□□00H	Positive logic	Forward rotation pulse train (positive direction pulse train)	Reverse rotation pulse train (negative direction pulse train)
□□01H		Pulse train + sign	
□□02H		A-phase pulse train B-phase pulse train	

Arrows in the table indicate the timing of importing pulse trains. A-phase and B-phase pulse trains are imported after they have been multiplied by 4.

Function selection A-5					
<div><div><div>0</div><div>0</div><div>0</div><div></div></div><div><div>Torque limit function selection at instantaneous power failure (instantaneous power failure tough drive selection)</div><div>0: Disabled</div><div>1: Enabled</div><div>When an instantaneous power failure occurs during operation, the torque at acceleration is limited to save electric energy charged in the capacitor in the servo amplifier and the time until AL. 10.2 (Voltage drop in the main circuit power) occurs is extended with the instantaneous power failure tough drive function. Consequently, you can set a longer time in parameter PF25 (SEMI-F47 function - Instantaneous power failure detection time). The torque limit function at instantaneous power failure is enabled when "SEMI-F47 function selection" in parameter PA20 is "Enabled (□1□□)".</div><div>This parameter setting is used with servo amplifier with software version A6 or later.</div><div>For manufacturer setting</div><div>000: Manufacturer setting</div></div></div>					

Tab. 7-2: Detailed overview of parameters PA for MR-J4-A (11)

7.2 MR-J4-A-RJ

7.2.1 Basic setting parameters

NOTES

To enable a parameter whose symbol is preceded by *, cycle the power after setting it.

Abbreviations of operation modes indicate the followings.

- Standard: Standard (semi closed loop system) use of the rotary servo motor
- Full.: Fully closed loop system use of the rotary servo motor
- Lin.: Linear servo motor use
- DD: Direct drive (DD) motor use

The symbols in the control mode column mean as follows.

- CP: Positioning mode (point table method)
- CL: Positioning mode (program method)
- PS: Positioning mode (indexer method)

PA05	*FBP	10000		1000–1000000	P														
Number of command input pulses per revolution																			
The servo motor rotates based on set command input pulses.																			
To enable the parameter value, set "Electronic gear selection" to "Number of command input pulses per revolution (1□□□)" in parameter PA21. "1□□□" cannot be set in parameter PA21 in the linear control mode.																			

Tab. 7-4: Detailed overview of parameters PA for MR-J4-A-RJ (2)

Number	Symbol	Initial value	Unit	Setting range	Control mode
PA06	*CMX	1		1-16777215	CP CL
Electronic gear numerator (command pulse multiplication numerator) Set an electronic gear numerator. (Refer to the instruction manual.) To enable the parameter values in the positioning mode, cycle the power after setting. To enable the parameter, select "Electronic gear (0□□□)", "J3 electronic gear setting value compatibility mode (2□□□)", or "J2S electronic gear setting value compatibility mode (3□□□)" of "Electronic gear selection" in parameter PA21. Set the electronic gear within the following range. Setting out of the range will trigger AL. 37 (Parameter error).					
Parameter PA21		Electronic gear setting range			
0□□□		(1/865) < (CMX/CDV) < 271471			
2□□□		(1/13825) < (CMX/CDV) < 16967			
3□□□		(1/27649) < (CMX/CDV) < 8484			
PA06	*CMX	1		1-16777215	PS
Number of gear teeth on machine side Set the number of gear teeth on machine side. (Refer to the instruction manual.) To enable the parameter values in the positioning mode, cycle the power after setting. Set the electronic gear within the following range. ① $1 \leq \text{CMX} \leq 16384, 1 \leq \text{CDV} \leq 16384$ ② $\frac{1}{9999} \leq \frac{\text{CMX}}{\text{CDV}} \leq 9999$ ③ $\text{CDV} \times \text{STN} \leq 32767$ (STN: Number of stations per rotation (parameter PT28)) ④ $\text{CMX} \times \text{CDV} \leq 100000$ Setting out of the range will trigger AL. 37 (Parameter error). When a small value is set to the electronic gear ratio with the manual operation mode, the servo motor may not drive at the set servo motor speed. Travel distance of 1 station = Pt (servo motor resolution) $\times \frac{1}{\text{STN}} \times \frac{\text{CMX}}{\text{CDV}}$					
PA07	*CDV	1		1-16777215	CP CL
Electronic gear denominator (command pulse multiplication denominator) Set an electronic gear denominator. (Refer to the instruction manual.) To enable the parameter values in the positioning mode, cycle the power after setting. To enable the parameter, select "Electronic gear (0□□□)", "J3 electronic gear setting value compatibility mode (2□□□)", or "J2S electronic gear setting value compatibility mode (3□□□)" of "Electronic gear selection" in parameter PA21. Set the electronic gear within the range of parameter PA06. Setting out of the range will trigger AL. 37 (Parameter error).					
PA07	*CDV	1		1-16777215	PS
Number of gear teeth on servo motor side Set the number of gear teeth on servo motor side. (Refer to the instruction manual.) To enable the parameter values in the positioning mode, cycle the power after setting. Set the electronic gear within the range of parameter PA06. Setting out of the range will trigger AL. 37 (Parameter error).

PA10	INP	100	Refer to text	0–65535	CP CL PS
In-position range Set an in-position range per command. To change it to the servo motor encoder pulse unit, set parameter PC24.					
Parameter PA01			In-position setting range		
<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> 6 (positioning mode (point table method))			The range where MEND (Travel completion), PED (Position end) and INP (In-position) are input.		
<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> 7 (Positioning mode (program method))					
<input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/> 8 (Positioning mode (indexer method))			The range where MEND (Travel completion) and INP (In-position) are input.		
The unit will be as follows depending on the positioning mode.					
• Point table method or program method Select from [μm], 10 ^{−4} [inch], 10 ^{−3} [degree], or [pulse] with parameter PT01.					
• Indexer method Command unit [pulse] (a load-side rotation expressed by the number of encoder resolution pulses) For example, when making an in-position range “± 1 degree” for the rotation angle on the load side, set 4194304 x (1/360) = 11650 pulses.

Command pulse input form

0

Refer to the previous page for the setting of these digits.

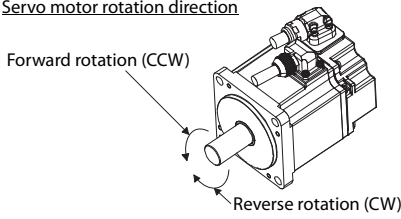

Command input pulse train filter selection
 Selecting proper filter enables to enhance noise immunity.
 0: Command input pulse train is 4 Mpulses/s or less.
 1: Command input pulse train is 1 Mpulse/s or less.
 2: Command input pulse train is 500 kpulses/s or less.
 3: Command input pulse train is 200 kpulses/s or less (available for the software version A5 or later)
 1 Mpulse/s or lower commands are supported by "1". When inputting commands over 1 Mpulse/s and 4 Mpulses/s or lower, set "0".
 When connecting the manual pulse generator MR-HDP01 in the positioning mode, set "2" or "3" to this digit.
 Incorrect setting may cause the following malfunctions.
 - Setting a value higher than actual command will lower noise immunity.
 - Setting a value lower than actual command will cause a position mismatch.

For manufacturer setting
 0: Manufacturer setting

Setting value	Pulse train form	Forward rotation (positive direction) command	Reverse rotation (negative direction) command
□□10H	Forward rotation pulse train (positive direction pulse train) Reverse rotation pulse train (negative direction pulse train)	PP  NP 	
□□11H	Pulse train + sign	PP  NP 	
□□12H	A-phase pulse train B-phase pulse train	PP  NP 	
□□00H	Forward rotation pulse train (positive direction pulse train) Reverse rotation pulse train (negative direction pulse train)	PP  NP 	
□□01H	Pulse train + sign	PP  NP 	
□□02H	A-phase pulse train B-phase pulse train	PP  NP 	

Arrows in the table indicate the timing of importing pulse trains. A-phase and B-phase pulse trains are imported after they have been multiplied by 4.
 When connecting the manual pulse generator MR-HDP01 in the positioning mode, set "□□02H".

7.3 MR-J4-B(-RJ)

NOTES

When you connect the amplifier to a servo system controller, servo parameter values of the servo system controller will be written to each parameter.

Setting may not be made to some parameters and their ranges depending on the servo system controller model, servo amplifier software version, and MR Configurator2 software version. For details, refer to the servo system controller user's manual.

7.3.1 Basic setting parameters

NOTES

The parameter whose symbol is preceded by * is enabled with the following conditions:

- *: After setting the parameter, cycle the power or reset the controller.
- **: After setting the parameter, cycle the power.

Abbreviations of operation modes indicate the followings.

- Standard: Standard (semi closed loop system) use of the rotary servo motor
- Full.: Fully closed loop system use of the rotary servo motor
- Lin.: Linear servo motor use
- DD: Direct drive (DD) motor use

Enabling absolute position detection system will trigger AL. 37 (Parameter error). Additionally, the setting is enabled only in the standard control mode. Setting other than "0" in other operation modes triggers AL. 37 (Parameter error).</p> </div> </div>				

Tab. 7-6: Detailed overview of parameters PA for MR-J4-B(-RJ) (8)

Number	Symbol	Initial value	Unit	Setting range
PA23	DRAT	0000H		Refer to text
Drive recorder arbitrary alarm trigger setting  <p>Alarm detail No. setting Set the digits when you execute the trigger with arbitrary alarm detail No. for the drive recorder function. When these digits are "0 0", only the arbitrary alarm No. setting will be enabled.</p> <p>Alarm No. setting Set the digits when you execute the trigger with arbitrary alarm No. for the drive recorder function. When "0 0" are set, arbitrary alarm trigger of the drive recorder will be disabled.</p> <p>Setting example: To activate the drive recorder when AL. 50 (Overload 1) occurs, set "5 0 0 0". To activate the drive recorder when AL. 50.3 (Thermal overload error 4 during operation) occurs, set "5 0 0 3".</p>				
PA24	AOP4	0000H		Refer to text
Function selection A-4  <p>Vibration suppression mode selection 0: Standard mode 1: 3 inertia mode 2: Low response mode When two low resonance frequencies are generated, select "3 inertia mode (□□□1)". When the load to motor inertia ratio exceeds the recommended load to motor inertia ratio, select "Low response mode (□□□2)". When you select the standard mode or low response mode, "Vibration suppression control 2" is not available. When you select the 3 inertia mode, the feed forward gain is not available. Before changing the control mode with the controller during the 3 inertia mode or low response mode, stop the motor.</p> <p>For manufacturer setting 000: Manufacturer setting</p>				
PA25	OTH0V	0	%	0-100
One-touch tuning -Overshoot permissible level Set a permissible value of overshoot amount for one-touch tuning as a percentage of the in-position range. Setting "0" will be 50%.				
PA26	*AOP5	0000H		Refer to text
Function selection A-5  <p>Torque limit function selection at instantaneous power failure (instantaneous power failure tough drive selection) 0: Disabled 1: Enabled When an instantaneous power failure occurs during operation, the torque at acceleration is limited to save electric energy charged in the capacitor in the servo amplifier and the time until AL. 10.2 (Voltage drop in the main circuit power) occurs is extended with the instantaneous power failure tough drive function. Consequently, you can set a longer time in parameter PF25 (SEMI-F47 function - Instantaneous power failure detection time). The torque limit function at instantaneous power failure is enabled when "SEMI-F47 function selection" in parameter PA20 is "Enabled (□1□□)". This parameter setting is used with servo amplifier with software version A6 or later.</p> <p>For manufacturer setting 000: Manufacturer setting</p>				

Tab. 7-6: Detailed overview of parameters PA for MR-J4-B(-RJ) (9)

7.4 MR-J4W-B

NOTES

When you connect the amplifier to a servo system controller, servo parameter values of the servo system controller will be written to each parameter.

Setting may not be made to some parameters and their ranges depending on the servo system controller model, servo amplifier software version, and MR Configurator2 software version. For details, refer to the servo system controller user's manual.

7.4.1 Basic setting parameters

NOTES

The parameter whose symbol is preceded by * is enabled with the following conditions:

- *: After setting the parameter, cycle the power or reset the controller.
- **: After setting the parameter, cycle the power.

How to set parameters:

- Each: Set parameters for each axis of A, B, and C.
- Common: Set parameters for common axis of A, B, and C. Be sure to set the same value to all axes.

The same values are set as default for all axes.

Abbreviations of operation modes indicate the followings.

- Standard: Standard (semi closed loop system) use of the rotary servo motor
- Full.: Fully closed loop system use of the rotary servo motor
- Lin.: Linear servo motor use
- DD: Direct drive (DD) motor use

Absolute position detection system

0

0

0

0: Disabled (used in incremental system)

1: Enabled (used in absolute position detection system)

For manufacturer setting

000: Manufacturer setting

Set this parameter when using the absolute position detection system. The parameter is not available in the speed control mode and torque control mode.

PA04	*AOP1	2000H		Refer to text	Common
------	-------	-------	--	---------------	--------

Function selection A-1

This is used to select the forced stop input and forced stop deceleration function.

0

0

For manufacturer setting

00: Manufacturer setting

Servo forced stop selection

0: Enabled (The forced stop input EM2 or EM1 is used.)

1: Disabled (The forced stop input EM2 and EM1 are not used.)

Refer to the following table for details.

Forced stop deceleration function selection

0: Forced stop deceleration function disabled (with EM1)

2: Forced stop deceleration function enabled (with EM2)

Refer to the following table for details.

Setting value	EM2/EM1	Deceleration method	
		EM2 or EM1 is off	Alarm occurred
00□□	EM1	MBR (Electromagnetic brake interlock) turns off without the forced stop deceleration.	MBR (Electromagnetic brake interlock) turns off without the forced stop deceleration.
20□□	EM2	MBR (Electromagnetic brake interlock) turns off after the forced stop deceleration.	MBR (Electromagnetic brake interlock) turns off after the forced stop deceleration.
01□□	Not using EM2 or EM1	—	MBR (Electromagnetic brake interlock) turns off without the forced stop deceleration.
21□□	Not using EM2 or EM1	—	MBR (Electromagnetic brake interlock) turns off after the forced stop deceleration.

One-touch tuning -Overshoot permissible level Set a permissible value of overshoot amount for one-touch tuning as a percentage of the in-position range. Setting "0" will be 50%.					

Tab. 7-8: Detailed overview of parameters PA for MR-J4W-B (9)

7.5 Other parameters

Only the basic setting parameters PA□□ are described in this manual for beginners.

The Appendix shows more tables about

- Gain/filter parameters PB□□
(Section A.1.3, section A.2.3, section A.3.3 or section A.4.3)
- Extension setting parameters PC□□
(Section A.1.4, section A.2.4, section A.3.4 or section A.4.4)
- I/O setting parameters PD□□
(Section A.1.5, section A.2.5, section A.3.5 or section A.4.5)
- Extension 2 setting parameters PE□□
(Section A.1.6, section A.2.6, section A.3.6 or section A.4.6)
- Extension 3 setting parameters PF□□
(Section A.1.7, section A.2.7, section A.3.7 or section A.4.7)
- Linear servo motor/DD motor setting parameters PL□□
(Section A.1.8, section A.2.8, section A.3.8 or section A.4.8)
- Option setting parameters Po□□
(Section A.2.9)
- Positioning control parameters PT□□
(Section A.2.10)

Please refer to the respective instruction manual of the servo amplifier series MR-J4-A, MR-J4-A-RJ, MR-J4-B and MR-J4W-B for more detailed settings and descriptions of these parameters.

8 Troubleshooting

8.1 Alarm and warning list MR-J4-A(-RJ)

NOTES

Refer to “MELSERVO J4 Servo Amplifier Instruction Manual (Troubleshooting)” for details of alarms and warnings.

As soon as an alarm occurs, turn SON (Servo-on) off and interrupt the power.

AL. 37 (Parameter error) and warnings (except AL. F0 (Tough drive warning)) are not recorded in the alarm history.

When an error occurs during operation, the corresponding alarm and warning are displayed. When the alarm or the warning occurs, refer to “MELSERVO J4 Servo Amplifier Instruction Manual (Troubleshooting)” to remove the failure. When an alarm occurs, ALM will turn off.

To output alarm codes, set parameter PD34 to “□□□1”. Alarm codes are outputted by on/off of bit 0 to bit 2.

Warnings (AL. 91 to AL. F3) do not have alarm codes. The alarm codes in the following table will be output when they occur. The alarm codes will not be output in normal condition.

After its cause has been removed, the alarm can be deactivated in any of the methods marked ✓ in the alarm deactivation column. Warnings are automatically cancelled after the cause of occurrence is removed. Alarms are deactivated with alarm reset or cycling the power.

Alarm deactivation	Explanation
Alarm reset	1. Turning on RES (Reset) with input device
	2. Pushing the “SET” button while the display of the servo amplifier is the current alarm display status
	3. Pushing the “Occurring Alarm Reset” button in the “Alarm Display” window of MR Configurator2
Cycling the power	Turning off the power and on again

Tab. 8-1: Methods of alarm deactivation

For the alarms and warnings in which “SD” is written in the stop method column, the axis stops with the dynamic brake after forced stop deceleration. For the alarms and warnings in which “DB” or “EDB” is written in the stop method column, the servo motor stops with the dynamic brake without forced stop deceleration.

Tab. 8-2: Alarm list of MR-J4-A(-RJ) (6)

- ① Leave for about 30 minutes of cooling time after removing the cause of occurrence.
- ② The following shows three stop methods of DB, EDB, and SD.
 DB: Stops with dynamic brake. (Coasts for the servo amplifier without dynamic brake.)
 EDB: Refer to the following table for the specified servo motors.
 The stop method for other than the specified servo motors will be DB.

Series	Servo Motor
HG-KR	HG-KR053, HG-KR13, HG-KR23, HG-KR43
HG-MR	HG-MR053, HG-MR13, HG-MR23, HG-MR43
HG-SR	HG-SR51, HG-SR52

SD: Forced stop deceleration

- ③ This is applicable when parameter PA04 is set to the initial value. The stop system of SD can be changed to DB using parameter PA04.
- ④ The alarm can be canceled by setting as follows:
 For the fully closed loop control: set parameter PE03 to "1□□□".
 When a linear servo motor or direct drive motor is used: set parameter PL04 to "1□□□".
- ⑤ Only for MR-J4-A-RJ

	No.	Name	Detail number	Detail name	Stop method ②, ③
Warning	90	Home position return incomplete warning	90.1 ⑤	Home position return incomplete	—
			90.2 ⑤	Home position return abnormal termination	—
			90.5 ⑤	Z-phase unpassed	—

			F0.3	Vibration tough drive warning	—
	F2	Drive recorder - Miswriting warning	F2.1	Drive recorder - Area writing time-out warning	—
			F2.2	Drive recorder - Data miswriting warning	—
	F3	Oscillation detection warning	F3.1	Oscillation detection warning	—

Tab. 8-3: Warning list of MR-J4-A(-RJ) (2)

- ① Leave for about 30 minutes of cooling time after removing the cause of occurrence.
- ② The following shows two stop methods of DB and SD.
 DB: Stops with dynamic brake. (Coasts for the servo amplifier without dynamic brake.)
 SD: Forced stop deceleration
- ③ This is applicable when parameter PA04 is set to the initial value. The stop system of SD can be changed to DB using parameter PA04.
- ④ Quick stop or slow stop can be selected using parameter PD30.
- ⑤ Only for MR-J4-A-RJ

8.2 Alarm and warning list MR-J4-B(-RJ)

NOTES

Refer to "MELSERVO J4 Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

As soon as an alarm occurs, turn SON (Servo-on) off and interrupt the power.

AL. 37 (Parameter error) and warnings are not recorded in the alarm history.

When an error occurs during operation, the corresponding alarm and warning are displayed. When the alarm or the warning occurs, refer to "MELSERVO J4 Servo Amplifier Instruction Manual (Troubleshooting)" to remove the failure. When an alarm occurs, ALM will turn off.

After its cause has been removed, the alarm can be deactivated in any of the methods marked ✓ in the alarm deactivation column. Warnings are automatically cancelled after the cause of occurrence is removed.

For the alarms and warnings in which "SD" is written in the stop method column, the axis stops with the dynamic brake after forced stop deceleration. For the alarms and warnings in which "DB" or "EDB" is written in the stop method column, the servo motor stops with the dynamic brake without forced stop deceleration.

Tab. 8-4: Alarm list of MR-J4-B(-RJ) (7)

- ① Leave for about 30 minutes of cooling time after removing the cause of occurrence.
- ② In some controller communication status, the alarm factor may not be removed.
- ③ The alarm can be cancelled by setting as follows:
 - For the fully closed loop control: set parameter PE03 to “1□□□”.
 - When a linear servo motor or a direct drive motor is used: set parameter PL04 to “1□□□”.
- ④ The following shows three stop methods of DB, EDB, and SD.

DB: Stops with dynamic brake. (Coasts for the servo amplifier without dynamic brake.)

EDB: Refer to the following table for the specified servo motors.

The stop method for other than the specified servo motors will be DB.

Series	Servo Motor
HG-KR	HG-KR053, HG-KR13, HG-KR23, HG-KR43
HG-MR	HG-MR053, HG-MR13, HG-MR23, HG-MR43
HG-SR	HG-SR51, HG-SR52

SD: Forced stop deceleration

- ⑤ This is applicable when parameter PA04 is set to the initial value. The stop system of SD can be changed to DB using parameter PA04.
- ⑥ This alarm will occur only in the J3 compatibility mode.

Tab. 8-5: Warning list of MR-J4-B(-RJ)

- ① Leave for about 30 minutes of cooling time after removing the cause of occurrence.
- ② The following shows two stop methods of DB and SD.
 DB: Stops with dynamic brake. (Coasts for the servo amplifier without dynamic brake.)
 SD: Forced stop deceleration
- ③ This is applicable when parameter PA04 is set to the initial value. The stop system of SD can be changed to DB using parameter PA04.

8.3 Alarm and warning list MR-J4W-B

NOTES

Refer to "MELSERVO J4 Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

If an alarm which indicates each axis in the stop method column occurs, the axis without the alarm operates the servo motor as per normal.

As soon as an alarm occurs, turn SON (Servo-on) off and interrupt the power.

AL. 37 (Parameter error) and warnings are not recorded in the alarm history.

When an error occurs during operation, the corresponding alarm and warning are displayed. When the alarm or the warning occurs, refer to "MELSERVO J4 Servo Amplifier Instruction Manual (Troubleshooting)" to remove the failure. When an alarm occurs, ALM□ (Malfunction for □-axis) will turn off.

After its cause has been removed, the alarm can be deactivated in any of the methods marked ✓ in the alarm deactivation column. Warnings are automatically cancelled after the cause of occurrence is removed.

For the alarms and warnings in which "SD" is written in the stop method column, the axis stops with the dynamic brake after forced stop deceleration. For the alarms and warnings in which "DB" or "EDB" is written in the stop method column, the servo motor stops with the dynamic brake without forced stop deceleration.

	No.	Name	Detail number	Detail name	Processing system ⑥	Stop system	Stop method ④⑤	Alarm deactivation		
								Error reset	CPU reset	Power off to on
Alarm	10	Undervoltage	10.1	Voltage drop in the control circuit power	Common	All axes	EDB	✓	✓	✓

Tab. 8-6: Alarm list of MR-J4W-B (7)

- ① Leave for about 30 minutes of cooling time after removing the cause of occurrence.
- ② In some controller communication status, the alarm factor may not be removed.
- ③ The alarm can be cancelled by setting as follows:
When a linear servo motor or a direct drive motor is used: set parameter PL04 to "1□□□".
- ④ The following shows three stop methods of DB, EDB, and SD.
DB: Stops with dynamic brake. (Coasts for the servo amplifier without dynamic brake.)
EDB: Refer to the following table for the specified servo motors.
The stop method for other than the specified servo motors will be DB.

Series	Servo Motor
HG-KR	HG-KR053, HG-KR13, HG-KR23, HG-KR43
HG-MR	HG-MR053, HG-MR13, HG-MR23, HG-MR43
HG-SR	HG-SR51, HG-SR52

SD: Forced stop deceleration

- ⑤ This is applicable when parameter PA04 is set to the initial value. The stop system of SD can be changed to DB using parameter PA04.
- ⑥ Processing system indicates as follows:
Each axis: an alarm is detected for each axis.
Common: an alarm is detected for the entire servo amplifier.
- ⑦ This alarm will occur only in the J3 compatibility mode.

	No.	Name	Detail number	Detail name	Processing system ①	Stop system	Stop method ②③
Warning	91	Servo amplifier overheat warning ①	91.1	Main circuit device overheat warning	Common	—	—
	92	Battery cable disconnection warning	92.1	Encoder battery cable disconnection warning	Each axis	—	—
			92.3	Battery degradation	Each axis	—	—
	95	STO warning	95.1	STO1 off detection	Common	All axes	DB
			95.2	STO2 off detection	Common	All axes	DB
	96	Home position setting warning	96.1	In-position warning at home positioning	Each axis	—	—
			96.2	Command input warning at home positioning	Each axis	—	—
	9F	Battery warning	9F.1	Low battery	Each axis	—	—
			9F.2	Battery degradation warning	Each axis	—	—
	E0	Excessive regeneration warning ①	E0.1	Excessive regeneration warning	Common	—	—
	E1	Overload warning 1 ①	E1.1	Thermal overload warning 1 during operation	Each axis	—	—
			E1.2	Thermal overload warning 2 during operation	Each axis	—	—
			E1.3	Thermal overload warning 3 during operation	Each axis	—	—
			E1.4	Thermal overload warning 4 during operation	Each axis	—	—
			E1.5	Thermal overload error 1 during a stop	Each axis	—	—
			E1.6	Thermal overload error 2 during a stop	Each axis	—	—
			E1.7	Thermal overload error 3 during a stop	Each axis	—	—
			E1.8	Thermal overload error 4 during a stop	Each axis	—	—
	E2	Servo motor overheat warning	E2.1	Servo motor temperature warning	Each axis	—	—
	E3	Absolute position counter warning	E3.2	Absolute position counter warning	Each axis	—	—
			E3.5	Encoder absolute positioning counter warning	Each axis	—	—
	E4	Parameter warning	E4.1	Parameter setting range error warning	Each axis	—	—
	E6	Servo forced stop warning	E6.1	Forced stop warning	Common	All axes	SD
	E7	Controller forced stop warning	E7.1	Controller forced stop warning	Common	All axes	SD
	E8	Cooling fan speed reduction warning	E8.1	Decreased cooling fan speed warning	Common	—	—
			E8.2	Cooling fan stop	Common	—	—
	E9	Main circuit off warning	E9.1	Servo-on signal on during main circuit off	Common	All axes	DB
			E9.2	Bus voltage drop during low speed operation	Common	All axes	DB
			E9.3	Ready-on signal on during main circuit off	Common	All axes	DB
	EB	The other axis error warning	EB.1	The other axis error warning	Each axis	All axes ④	DB
	EC	Overload warning 2 ①	EC.1	Overload warning 2	Each axis	—	—
	ED	Output watt excess warning	ED.1	Output watt excess warning	Each axis	—	—

Tab. 8-7: Warning list of MR-J4W-B (1)

	No.	Name	Detail number	Detail name	Processing system ④	Stop system	Stop method ②, ③
Warning	F0	Tough drive warning	F0.1	Instantaneous power failure tough drive warning	Each axis	—	—
			F0.3	Vibration tough drive warning	Each axis	—	—
	F2	Drive recorder - Miswriting warning	F2.1	Drive recorder - Area writing time-out warning	Common	—	—
			F2.2	Drive recorder - Data miswriting warning	Common	—	—
	F3	Oscillation detection warning	F3.1	Oscillation detection warning	Each axis	—	—

Tab. 8-7: Warning list of MR-J4W-B (2)

- ① Leave for about 30 minutes of cooling time after removing the cause of occurrence.
- ② The following shows two stop methods of DB and SD.
 DB: Stops with dynamic brake. (Coasts for the servo amplifier without dynamic brake.)
 SD: Forced stop deceleration
- ③ This is applicable when parameter PA04 is set to the initial value. The stop system of SD can be changed to DB using parameter PA04.
- ④ Stopping all axes or each axis can be selected using parameter PF02.
- ⑤ Processing system indicates as follows:
 Each axis: an alarm is detected for each axis.
 Common: an alarm is detected for the entire servo amplifier

8.4 Remedies for alarms

**WARNING:**

- *When any alarm has occurred, eliminate its cause, ensure safety, and deactivate the alarm before restarting operation. Otherwise, it may cause injury.*
- *If AL. 25 (Absolute position erased) occurs, always make home position setting again. Otherwise, it may cause an unexpected operation.*
- *As soon as an alarm occurs, make the Servo-off status and interrupt the main circuit power.*

NOTES

When any of the following alarms has occurred, do not cycle the power repeatedly to restart. Doing so will cause a malfunction of the servo amplifier and the servo motor. Remove its cause and allow about 30 minutes for cooling before resuming the operation.

- AL. 30 (Regenerative error)
- AL. 45 (Main circuit device overheat)
- AL. 46 (Servo motor overheat)
- AL. 50 (Overload 1)
- AL. 51 (Overload 2)

AL. 37 (Parameter error) is not recorded in the alarm history.

Remove the cause of the alarm in accordance with this chapter. Use MR Configurator2 to refer to a factor of alarm occurrence.

8.5 Remedies for warnings

**WARNING:**

If AL. E3 (Absolute position counter warning) occurs, always make home position setting again. Otherwise, it may cause an unexpected operation.

NOTES

When any of the following warnings has occurred, do not cycle the power of the servo amplifier repeatedly to restart. Doing so will cause a malfunction of the servo amplifier and the servo motor. If the power of the servo amplifier is switched off/on during the alarms, allow more than 30 minutes for cooling before resuming operation.

- AL. 91 (Servo amplifier overheat warning)
- AL. E0 (Excessive regeneration warning)
- AL. E1 (Overload warning 1)
- AL. E2 (Servo motor overheat warning)
- AL. EC (Overload warning 2)

Warnings are not recorded in the alarm history.

If AL. E6, AL. E7, AL. E9, AL. EA, or AL. EB occurs, the servo-off status is established. If any other warning occurs, operation can be continued but an alarm may take place or proper operation may not be performed.

Remove the cause of warning according to this chapter. Use MR Configurator2 to refer to a factor of warning occurrence.

8.6 Trouble which does not trigger alarm/warning

For possible causes which do not trigger alarm or warning refer to “MELSERVO J4 Servo Amplifier Instruction Manual (Troubleshooting)”.

Remove each cause referring to the respective sections of the manuals.

A Appendix

A.1 Additional information about the series MR-J4-A

A.1.1 Status Display

Status display	Symbol	Unit	Description
Cumulative feedback pulses	C	pulse	Feedback pulses from the servo motor encoder are counted and displayed. The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits. Press the "SET" button to reset the display value to zero. The value of minus is indicated by the lit decimal points in the upper four digits.
Servo motor speed/ Linear servo motor speed	r	1/min mm/s	The servo motor speed or Linear servo motor speed is displayed. It is displayed rounding off 0.1 1/min (0.1 mm/s) unit.
Droop pulses	E	pulse	The number of droop pulses in the deviation counter are displayed. The decimal points in the upper four digits are lit for reverse rotation pulses. The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits. The number of pulses displayed is in the encoder pulse unit.
Cumulative command pulses	P	pulse	Position command input pulses are counted and displayed. As the value displayed is not yet multiplied by the electronic gear (CMX/CDV), it may not match the indication of the cumulative feedback pulses. The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits. Press the "SET" button to reset the display value to zero. When the servo motor is rotating in the reverse direction, the decimal points in the upper four digits are lit.
Command pulse frequency	n	kpulse/s	The frequency of position command input pulses is counted and displayed. The value displayed is not multiplied by the electronic gear (CMX/CDV).
Analog speed command voltage Analog speed limit voltage	F	V	1) Torque control mode Input voltage of VLA (Analog speed limit) voltage is displayed.
			2) Speed control mode Input voltage of VC (Analog speed command) voltage is displayed
Analog torque command voltage Analog torque limit voltage	U	V	1) Position control mode and speed control mode Voltage of TLA (Analog torque limit) voltage is displayed.
			2) Torque control mode Voltage of TC (Analog torque command) voltage is displayed.
Regenerative load ratio	L	%	The ratio of regenerative power to permissible regenerative power is displayed in %.
Effective load ratio	J	%	The continuous effective load current is displayed. The effective value in the past 15 s is displayed relative to the rated current of 100 %.
Peak load ratio	b	%	The maximum occurrence torque is displayed. The highest value in the past 15 s is displayed relative to the rated current of 100 %.
Instantaneous torque	T	%	The instantaneous occurrence torque is displayed. The value of torque being occurred is displayed in real time considering a rated torque as 100 %.
Within one-revolution position (1 pulse unit)	Cy1	pulse	Position within one revolution is displayed in encoder pulses. The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits. When the servo motor rotates in the CCW direction, the value is added.
Within one-revolution position (1000 pulse unit)	Cy2	1000 pulses	The within one-revolution position is displayed in 1000 pulse increments of the encoder. When the servo motor rotates in the CCW direction, the value is added.
ABS counter	LS	rev	The travel distance from the home position is displayed as multi-revolution counter value of the absolute position encoder in the absolute position detection system.
Load to motor inertia ratio	dC	Multiplier	The estimated ratio of the load inertia moment to the servo motor shaft inertia moment is displayed.

Tab. A-1: Status display list of MR-J4-A (1)

Status display	Symbol	Unit	Description
Bus voltage	Pn	V	The voltage of main circuit converter (between P+ and N-) is displayed.
Encoder inside temperature	ETh	°C	Inside temperature of encoder detected by the encoder is displayed.
Settling time	ST	ms	Settling time is displayed. When it exceeds 1000 ms, "1000" will be displayed.
Oscillation detection frequency	oF	Hz	Frequency at the time of oscillation detection is displayed.
Number of tough drive operations	Td	times	The number of tough drive functions activated is displayed.
Unit power consumption 1 (increment of 1 W)	PC1	W	Unit power consumption is displayed by increment of 1 W. Positive value indicate power running, and negative value indicate regeneration. The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits.
Unit power consumption 2 (increment of 1 kW)	PC2	kW	Unit power consumption is displayed by increment of 1 kW. Positive value indicate power running, and negative value indicate regeneration.
Unit total power consumption 1 (increment of 1 Wh)	TPC1	Wh	Unit total power consumption is displayed by increment of 1 Wh. Positive value is cumulated during power running and negative value during regeneration. The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits.
Unit total power consumption 2 (increment of 100 kWh)	TPC2	100 kWh	Unit total power consumption is displayed by increment of 100 kWh. Positive value is cumulated during power running and negative value during regeneration.
Load-side encoder Cumulative feedback pulses	FC	pulse	Feedback pulses from the load-side encoder are counted and displayed. The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits. Press the "SET" button to reset the display value to zero. The value of minus is indicated by the lit decimal points in the upper four digits.
Load-side encoder Droop pulses	FE	pulse	Droop pulses of the deviation counter between a load-side encoder and a command are displayed. When the count exceeds ± 99999 , it starts from 0. Negative value is indicated by the lit decimal points in the upper four digits. The display shows the average droop pulses of 128 samplings at the rate of 444 μ s.
Load-side encoder information 1 (1 pulse unit)	FCY1	pulse	The Z-phase counter of a load-side encoder is displayed in the encoder pulse unit. For an incremental linear encoder, the Z-phase counter is displayed. The value is counted up from 0 based on the home position (reference mark). For an absolute position linear encoder, the encoder absolute position is displayed. When the count exceeds 99999, it starts from 0.
Load-side encoder information 1 (100 pulses unit)	FCY2	100 pulses	The Z-phase counter of a load-side encoder is displayed by increments of 100 pulses. For an incremental linear encoder, the Z-phase counter is displayed. The value is counted up from 0 based on the home position (reference mark). For an absolute position linear encoder, the encoder absolute position is displayed. When the count exceeds 99999, it starts from 0.
Load-side encoder information 2	FL5	rev	When an incremental linear encoder is used as the load-side encoder, the display shows 0. When an absolute position linear encoder is used as the load-side encoder, the display shows 0. When a rotary encoder is used as the load-side encoder, the display shows the value of the multi-revolution counter.
Z-phase counter low	FCY1	pulse	The Z-phase counter is displayed in the encoder pulse unit. For an incremental linear encoder, the Z-phase counter is displayed. The value is counted up from 0 based on the home position (reference mark). For an absolute position linear encoder, the encoder absolute position is displayed. When the count exceeds 99999, it starts from 0.
Z-phase counter high	FCY2	100000 pulses	The Z-phase counter is displayed by increments of 100000 pulses. For an incremental linear encoder, the Z-phase counter is displayed. The value is counted up from 0 based on the home position (reference mark). For an absolute position linear encoder, the encoder absolute position is displayed. When the count exceeds 99999, it starts from 0.
Electrical angle low	ECY1	pulse	The servo motor electrical angle is displayed.
Electrical angle high	ECY2	100000 pulses	The servo motor electrical angle is displayed by increments of 100000 pulses.

Tab. A-1: Status display list of MR-J4-A (2)

The status display item of the servo amplifier display shown at power-on can be changed by changing parameter PC36 settings.

Tab. A-8: List of linear servo motor/DD motor setting parameters for MR-J4-A (2)

NOTES

To enable a parameter whose symbol is preceded by *, cycle the power after setting it.

Abbreviations of operation modes indicate the followings.

- Standard: Standard (semi closed loop system) use of the rotary servo motor
- Full.: Fully closed loop system use of the rotary servo motor
- Lin.: Linear servo motor use
- DD: Direct drive (DD) motor use

The symbols in the control mode column mean as follows.

- P: Position control mode
- S: Speed control mode
- T: Torque control mode

A.2 Additional information about the series MR-J4-A-RJ

A.2.1 Status Display

Status display	Symbol	Unit	Description	Control mode ^①			Operation mode ^②			
				CP	CL	PS	Standard	Full.	Lin.	DD
Cumulative feedback pulses	C	pulse	Feedback pulses from the servo motor encoder are counted and displayed. The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits. Press the "SET" button to reset the display value to zero. The value of minus is indicated by the lit decimal points in the upper four digits.	✓	✓	✓	✓	✓	✓	✓
Servo motor speed/ Linear servo motor speed	r	1/min mm/s	The servo motor speed or Linear servo motor speed is displayed. It is displayed rounding off 0.1 1/min (0.1 mm/s) unit.	✓	✓	✓	✓	✓	✓	✓
Droop pulses	E	pulse	The number of droop pulses in the deviation counter are displayed. The decimal points in the upper four digits are lit for reverse rotation pulses. The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits. The number of pulses displayed is in the encoder pulse unit.	✓	✓	✓	✓	✓	✓	✓
Cumulative command pulses	P	pulse	Not used with the positioning mode. "0" is always displayed.	—	—	—	—	—	—	—
Command pulse frequency	n	kpulse/s	Not used with the positioning mode. "0" is always displayed.	—	—	—	—	—	—	—
Analog speed command voltage Analog speed limit voltage	F	V	Not used with the positioning mode. An applied voltage to the CN1 connector is displayed.	—	—	—	—	—	—	—
Analog torque command voltage	U	V	Not used with the positioning mode. An applied voltage to the CN1 connector is displayed.	—	—	—	—	—	—	—
Analog torque limit voltage			Voltage of TC (Analog torque command) voltage is displayed.	✓	✓	✓	✓	✓	✓	✓
Regenerative load ratio	L	%	The ratio of regenerative power to permissible regenerative power is displayed in %.	✓	✓	✓	✓	✓	✓	✓
Effective load ratio	J	%	The continuous effective load current is displayed. The effective value in the past 15 s is displayed relative to the rated current of 100 %.	✓	✓	✓	✓	✓	✓	✓
Peak load ratio	b	%	The maximum occurrence torque is displayed. The highest value in the past 15 s is displayed relative to the rated current of 100 %.	✓	✓	✓	✓	✓	✓	✓
Instantaneous torque	T	%	The instantaneous occurrence torque is displayed. The value of torque being occurred is displayed in real time considering a rated torque as 100 %.	✓	✓	✓	✓	✓	✓	✓
Position within one-revolution (1 pulse unit)	Cy1	pulse	Position within one revolution is displayed in encoder pulses. The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits. When the servo motor rotates in the CCW direction, the value is added.	✓	✓	✓	✓	✓	✓	✓

Tab. A-9: Status display list of MR-J4-A-RJ (1)

Status display	Symbol	Unit	Description	Control mode ①			Operation mode ②			
				CP	CL	PS	Standard	Full.	Lin.	DD
Position within one-revolution (1000 pulse unit)	Cy2	1000 pulses	The within one-revolution position is displayed in 1000 pulse increments of the encoder. When the servo motor rotates in the CCW direction, the value is added.	✓	✓	✓	✓	✓	✓	✓
ABS counter	LS	rev	The travel distance from the home position is displayed as multi-revolution counter value of the absolute position encoder in the absolute position detection system.	✓	✓	—	✓	✓	✓	✓
			The travel distance from the home position is displayed as load side multi-revolution counter value in the absolute position detection system	—	—	✓	✓	✓	✓	✓
Load to motor inertia ratio	dC	Multiplier	The estimated ratio of the load inertia moment to the servo motor shaft inertia moment is displayed.	✓	✓	✓	✓	✓	✓	✓
Bus voltage	Pn	V	The voltage of main circuit converter (between P+ and N-) is displayed.	✓	✓	✓	✓	✓	✓	✓
Encoder inside temperature	ETh	°C	Inside temperature of encoder detected by the encoder is displayed.	✓	✓	✓	✓	✓	—	✓
Settling time	ST	ms	Settling time is displayed. When it exceeds 1000 ms, "1000" will be displayed.	✓	✓	✓	✓	✓	✓	✓
Oscillation detection frequency	oF	Hz	Frequency at the time of oscillation detection is displayed.	✓	✓	✓	✓	✓	✓	✓
Number of tough drive operations	Td	times	The number of tough drive functions activated is displayed.	✓	✓	✓	✓	✓	✓	✓
Unit power consumption 1 (increment of 1 W)	PC1	W	Unit power consumption is displayed by increment of 1 W. Positive value indicate power running, and negative value indicate regeneration. The values in excess of ±99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits.	✓	✓	✓	✓	✓	✓	✓
Unit power consumption 2 (increment of 1 kW)	PC2	kW	Unit power consumption is displayed by increment of 1 kW. Positive value indicate power running, and negative value indicate regeneration.	✓	✓	✓	✓	✓	✓	✓
Unit total power consumption 1 (increment of 1 Wh)	TPC1	Wh	Unit total power consumption is displayed by increment of 1 Wh. Positive value is cumulated during power running and negative value during regeneration. The values in excess of ±99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits.	✓	✓	✓	✓	✓	✓	✓
Unit total power consumption 2 (increment of 100 kWh)	TPC2	100 Wh	Unit total power consumption is displayed by increment of 100 kWh. Positive value is cumulated during power running and negative value during regeneration.	✓	✓	✓	✓	✓	✓	✓
Load-side encoder Cumulative feedback pulses	FC	pulse	Feedback pulses from the load-side encoder are counted and displayed. The values in excess of ±99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits. Press the "SET" button to reset the display value to zero. The value of minus is indicated by the lit decimal points in the upper four digits.	✓	✓	—	—	✓	—	—
Load-side encoder Droop pulses	FE	pulse	Droop pulses of the deviation counter between a load-side encoder and a command are displayed. When the count exceeds ±99999, it starts from 0. Negative value is indicated by the lit decimal points in the upper four digits. The display shows the average droop pulses of 128 samplings at the rate of 444 [μs].	✓	✓	—	—	✓	—	—

Tab. A-9: Status display list of MR-J4-A-RJ (2)

Status display	Symbol	Unit	Description	Control mode ①			Operation mode ②			
				CP	CL	PS	Standard	Full.	Lin.	DD
Load-side encoder information 1 (1 pulse unit)	FCY1	pulse	The Z-phase counter of a load-side encoder is displayed in the encoder pulse unit. For an incremental linear encoder, the Z-phase counter is displayed. The value is counted up from 0 based on the home position (reference mark). For an absolute position linear encoder, the encoder absolute position is displayed. When the count exceeds 99999, it starts from 0.	✓	✓	—	—	✓	—	—
Load-side encoder information 1 (100000 pulses unit)	FCY2	100000 pulses	The Z-phase counter of a load-side encoder is displayed by increments of 100 pulses. For an incremental linear encoder, the Z-phase counter is displayed. The value is counted up from 0 based on the home position (reference mark). For an absolute position linear encoder, the encoder absolute position is displayed. When the count exceeds 99999, it starts from 0.	✓	✓	—	—	✓	—	—
Load-side encoder information 2	FL5	rev	When an incremental linear encoder is used as the load-side encoder, the display shows 0. When an absolute position linear encoder is used as the load-side encoder, the display shows 0. When a rotary encoder is used as the load-side encoder, the display shows the value of the multi-revolution counter.	✓	✓	—	—	✓	—	—
Z-phase counter low	FCY1	pulse	The Z-phase counter is displayed in the encoder pulse unit. For an incremental linear encoder, the Z-phase counter is displayed. The value is counted up from 0 based on the home position (reference mark). For an absolute position linear encoder, the encoder absolute position is displayed. When the count exceeds 99999, it starts from 0.	✓	✓	✓	—	—	✓	—
Z-phase counter high	FCY2	100000 pulses	The Z-phase counter is displayed by increments of 100000 pulses. For an incremental linear encoder, the Z-phase counter is displayed. The value is counted up from 0 based on the home position (reference mark). For an absolute position linear encoder, the encoder absolute position is displayed. When the count exceeds 99999, it starts from 0.	✓	✓	✓	—	—	✓	—
Electrical angle low	ECY1	pulse	The servo motor electrical angle is displayed.	✓	✓	—	—	—	✓	—
Electrical angle high	ECY2	100000 pulses	The servo motor electrical angle is displayed by increments of 100000 pulses.	✓	✓	—	—	—	✓	—
Current position	PoS	$10^{\text{STM}}\mu\text{m}$ $10^{(\text{STM}-4)}\text{inch}$ 10^{-3}degree pulse ③	When "□□□□" (positioning display) is set in parameter PT26, the current position is displayed as machine home position is 0. When "□□1□" (roll feed display) is set in parameter PT26, the actual current position is displayed as start position is 0. The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits.	✓	✓	—	✓	✓	✓	✓

Tab. A-9: Status display list of MR-J4-A-RJ (3)

Status display	Symbol	Unit	Description	Control mode ①			Operation mode ②			
				CP	CL	PS	Standard	Full.	Lin.	DD
Command position	CPoS	$10^{STM} \mu\text{m}$ $10^{(STM-4)} \text{inch}$ $10^{-3} \text{degree pulse}^{③}$	<p>When "□□0□" (positioning display) is set in parameter PT26, the command current position is displayed as machine home position is 0.</p> <p>When "□□1□" (roll feed display) is set in parameter PT26, turning on the start signal starts counting from 0 and a command current position to the target position is displayed in the automatic mode.</p> <p>The command positions of the selected point table are displayed at a stop. At the manual mode, the command positions of the selected point table are displayed.</p> <p>The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits.</p>	✓	✓	—	✓	✓	✓	✓
Command remaining distance	rn	$10^{STM} \mu\text{m}$ $10^{(STM-4)} \text{inch}$ $10^{-3} \text{degree pulse}^{③}$	<p>Indicates the remaining distance to the command position of the currently selected point table, program and station.</p> <p>The values in excess of ± 99999 can be counted. However, the counter shows only the lower five digits of the actual value since the servo amplifier display is five digits.</p>	✓	✓	✓	✓	✓	✓	✓
Point table No./program No./command station position	Pno	—	For the point table method and program method, the point table and program No. currently being executed are displayed. The selected number is displayed during a temporary stop or manual operation. For the indexer method, the command next station position is displayed.	✓	✓	✓	✓	✓	✓	✓
Step No.	Sno	—	The step No. of the program currently being executed is displayed. At a stop, 0 is displayed.	—	✓	—	✓	✓	✓	✓
Analog override voltage	oru	V	The analog override voltage is displayed.	✓	✓	—	✓	✓	✓	✓
Override level	or	%	<p>The setting value of the override is displayed.</p> <p>When the override is disabled, 100% is displayed.</p>	✓	✓	✓	✓	✓	✓	✓

Tab. A-9: Status display list of MR-J4-A-RJ (4)

- ① CP: Positioning mode (point table method)
 CL: Positioning mode (program method)
 PS: Positioning mode (indexer method)

- ② Standard: Standard (semi closed loop system) use of the rotary servo motor
 Full.: Fully closed loop system use of the rotary servo motor
 Lin.: Linear servo motor use
 DD: Direct drive (DD) motor use

- ③ The unit can be changed to μm /Inch/Degree/PLS in parameter PT01.

The status display item of the servo amplifier display shown at power-on can be changed by changing parameter PC36 settings.

Tab. A-10: List of basic setting parameters for MR-J4-A-RJ

NOTES

To enable the following parameters in a positioning mode, cycle the power after setting.

- PA06 (Electronic gear numerator (command pulse multiplication numerator)/Number of gear teeth on machine side)
- PA07 (Electronic gear denominator (command pulse multiplication denominator)/Number of gear teeth on servo motor side)

The following parameter cannot be used in the positioning mode.

- PA05 (Number of command input pulses per revolution)

NOTES

To enable the following parameters in a positioning mode, cycle the power after setting.

- PC03 (S-pattern acceleration/deceleration time constant)

The following parameter cannot be used in the positioning mode.

- PC04 (Torque command time constant/thrust command time constant)
- PC08 (Internal speed command 4/internal speed limit 4)
- PC09 (Internal speed command 5/internal speed limit 5)
- PC10 (Internal speed command 6/internal speed limit 6)
- PC11 (Internal speed command 7/internal speed limit 7)
- PC12 (Analog speed command - Maximum speed/Analog speed limit - Maximum speed)
- PC13 (Analog torque/thrust command maximum output)
- PC23 (Function selection C-2)
- PC32 (Command input pulse multiplication numerator 2)
- PC33 (Command input pulse multiplication numerator 3)
- PC34 (Command input pulse multiplication numerator 4)

Tab. A-18: List of positioning control parameters for MR-J4-A-RJ (2)**NOTES**

To enable a parameter whose symbol is preceded by *, cycle the power after setting it.

Abbreviations of operation modes indicate the followings.

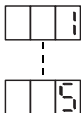

- Standard: Standard (semi closed loop system) use of the rotary servo motor
- Full.: Fully closed loop system use of the rotary servo motor
- Lin.: Linear servo motor use
- DD: Direct drive (DD) motor use

The symbols in the control mode column mean as follows.

- CP: Positioning mode (point table method)
- CL: Positioning mode (program method)
- PS: Positioning mode (indexer method)

A.3 Additional information about the series MR-J4-B(-RJ)

A.3.1 Status display

Display	Status	Description
	Initializing	System check in progress
	Initializing	<ul style="list-style-type: none"> Power of the servo amplifier was switched on at the condition that the power of the servo system controller is off. The control axis No. set to the auxiliary axis number setting switches (SW2-3 and SW2-4) and the axis selection rotary switch (SW1) do not match the one set to the servo system controller. A servo amplifier malfunctioned, or communication error occurred with the servo system controller or the previous axis servo amplifier. In this case, the indication changes as follows: "Ab", "AC", "Ad", and "Ab" The servo system controller is malfunctioning.
	Initializing	During initial setting for communication specifications
	Initializing	Initial setting for communication specifications completed, and then it synchronized with servo system controller.
	Initializing	During initial parameter setting communication with servo system controller
	Initializing	During the servo motor/encoder information and telecommunication with servo system controller
	Initializing	During initial signal data communication with servo system controller
	Initializing completion	The process for initial data communication with the servo system controller is completed.
	Initializing standby	The power supply of servo system controller is turned off during the power supply of servo amplifier is on.
	Ready-off	The ready-off signal from the servo system controller was received.
	Servo-on	The ready-off signal from the servo system controller was received.
	Servo-off	The ready-off signal from the servo system controller was received.
	Alarm and warning	The alarm No. and the warning No. that occurred is displayed. ^④
	CPU error	CPU watchdog error has occurred.
  	Test operation mode ^③	Motor-less operation

Tab. A-19: Indication list of MR-J4-B(-RJ)

^① The meanings of ## are listed below.

##	Description
01	Axis No. 1
?	?
64	Axis No. 64

^② ** indicates the alarm No. and the warning No.

^③ Requires the MR Configurator2.

^④ Only a list of alarms and warnings is listed in section 8.2. Refer to "MELSERVO J4 Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

Tab. A-26: List of linear servo motor/DD motor setting parameters for MR-J4-B(-RJ) (2)

NOTES

The parameter whose symbol is preceded by * is enabled with the following conditions:

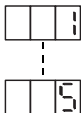

- *: After setting the parameter, cycle the power or reset the controller.
- **: After setting the parameter, cycle the power.

Abbreviations of operation modes indicate the followings.

- Standard: Standard (semi closed loop system) use of the rotary servo motor
- Full.: Fully closed loop system use of the rotary servo motor
- Lin.: Linear servo motor use
- DD: Direct drive (DD) motor use

A.4 Additional information about the series MR-J4W-B

A.4.1 Status display

Display	Status	Description
	Initializing	System check in progress
	Initializing	<ul style="list-style-type: none"> Power of the servo amplifier was switched on at the condition that the power of the servo system controller is off. The control axis No. set to the auxiliary axis number setting switches (SW2-5 and SW2-6) and the axis selection rotary switch (SW1) do not match the one set to the servo system controller. A servo amplifier malfunctioned, or communication error occurred with the servo system controller or the previous axis servo amplifier. In this case, the indication changes as follows: "Ab", "AC", "Ad", and "Ab" The servo system controller is malfunctioning.
	Initializing	During initial setting for communication specifications
	Initializing	Initial setting for communication specifications completed, and then it synchronized with servo system controller.
	Initializing	During initial parameter setting communication with servo system controller
	Initializing	During the servo motor/encoder information and telecommunication with servo system controller
	Initializing	During initial signal data communication with servo system controller
	Initializing completion	The process for initial data communication with the servo system controller is completed.
	Initializing standby	The power supply of servo system controller is turned off during the power supply of servo amplifier is on.
	Ready-off	The ready-off signal from the servo system controller was received.
	Servo-on	The ready-off signal from the servo system controller was received.
	Servo-off	The ready-off signal from the servo system controller was received.
	Alarm and warning	The alarm No. and the warning No. that occurred is displayed. ^④
	CPU error	CPU watchdog error has occurred.
  	Test operation mode ^③	Motor-less operation

Tab. A-27: Indication list of MR-J4W-B

^① The meanings of ## are listed below.

##	Description
01	Axis No. 1
?	?
64	Axis No. 64

^② *** indicates the alarm No. and the warning No. "A" in the third digit indicates the A-axis, "B" indicates the B-axis, and "C" indicates the C-axis.

^③ Only a list of alarms and warnings is listed in section 8.3. Refer to "MELSERVO J4 Servo Amplifier Instruction Manual (Troubleshooting)" for details of alarms and warnings.

Tab. A-34: List of linear servo motor/DD motor setting parameters for MR-J4W-B (2)

NOTES

The parameter whose symbol is preceded by * is enabled with the following conditions:

- *: After setting the parameter, cycle the power or reset the controller.
- **: After setting the parameter, cycle the power.

How to set parameters

- Each: Set parameters for each axis of A, B, and C.
- Common: Set parameters for common axis of A, B, and C. Be sure to set the same value to all axes.

The same values are set as default for all axes.

Abbreviations of operation modes indicate the followings.

- Standard: Standard (semi closed loop system) use of the rotary servo motor
- Full.: Fully closed loop system use of the rotary servo motor
- Lin.: Linear servo motor use
- DD: Direct drive (DD) motor use
